

CS 12 - Lab 4

Strings

Write a program that asks the user to enter a string and an integer. The string should be able to contain white space and hold up to 100 characters. The integer stands for a word length. You should then go through the string and print out all the words that have a length equal to the amount the user specified. For example, given

```
str = 'Today is a fun day'  
word_length = 3
```

The output should be:

```
fun  
day
```
