

Lighting and Shading

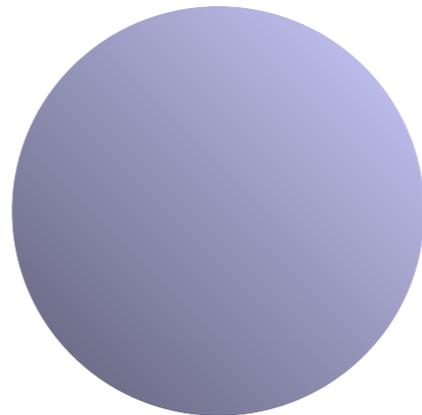

Slides: Tamar Shinar, Victor Zordon

Why we need shading

- Suppose we build a model of a sphere using many polygons and color each the same color. We get something like

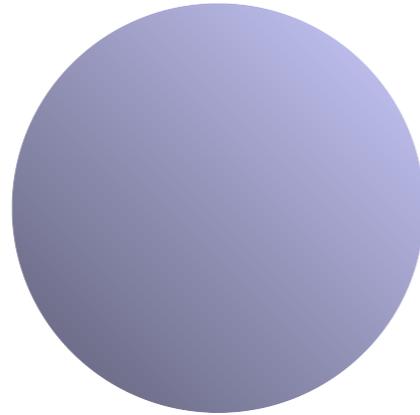

- But we want

Shading

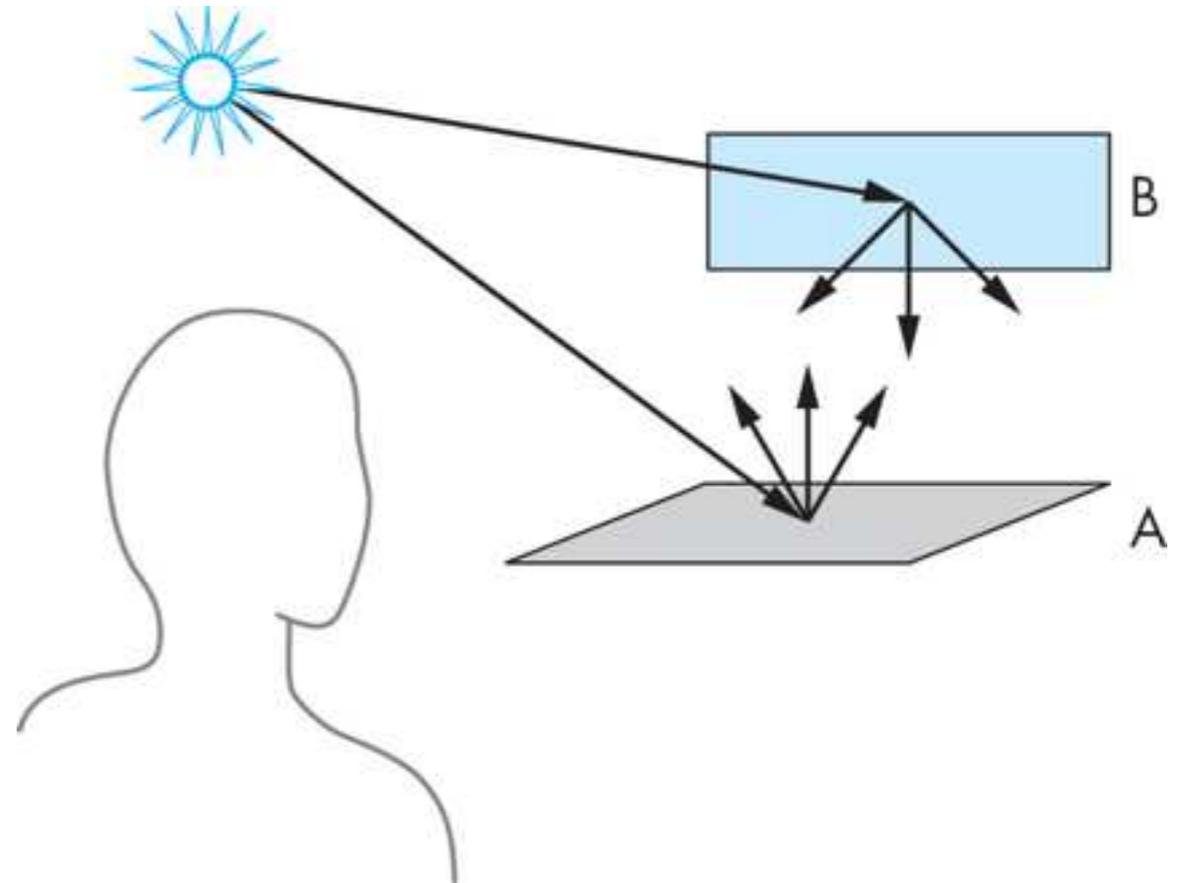

- Why does the image of a real sphere look like

- Light-material interactions cause each point to have a different color or shade
- Need to consider
 - Light sources
 - Material properties
 - Location of viewer
 - Surface orientation (normal)

General rendering

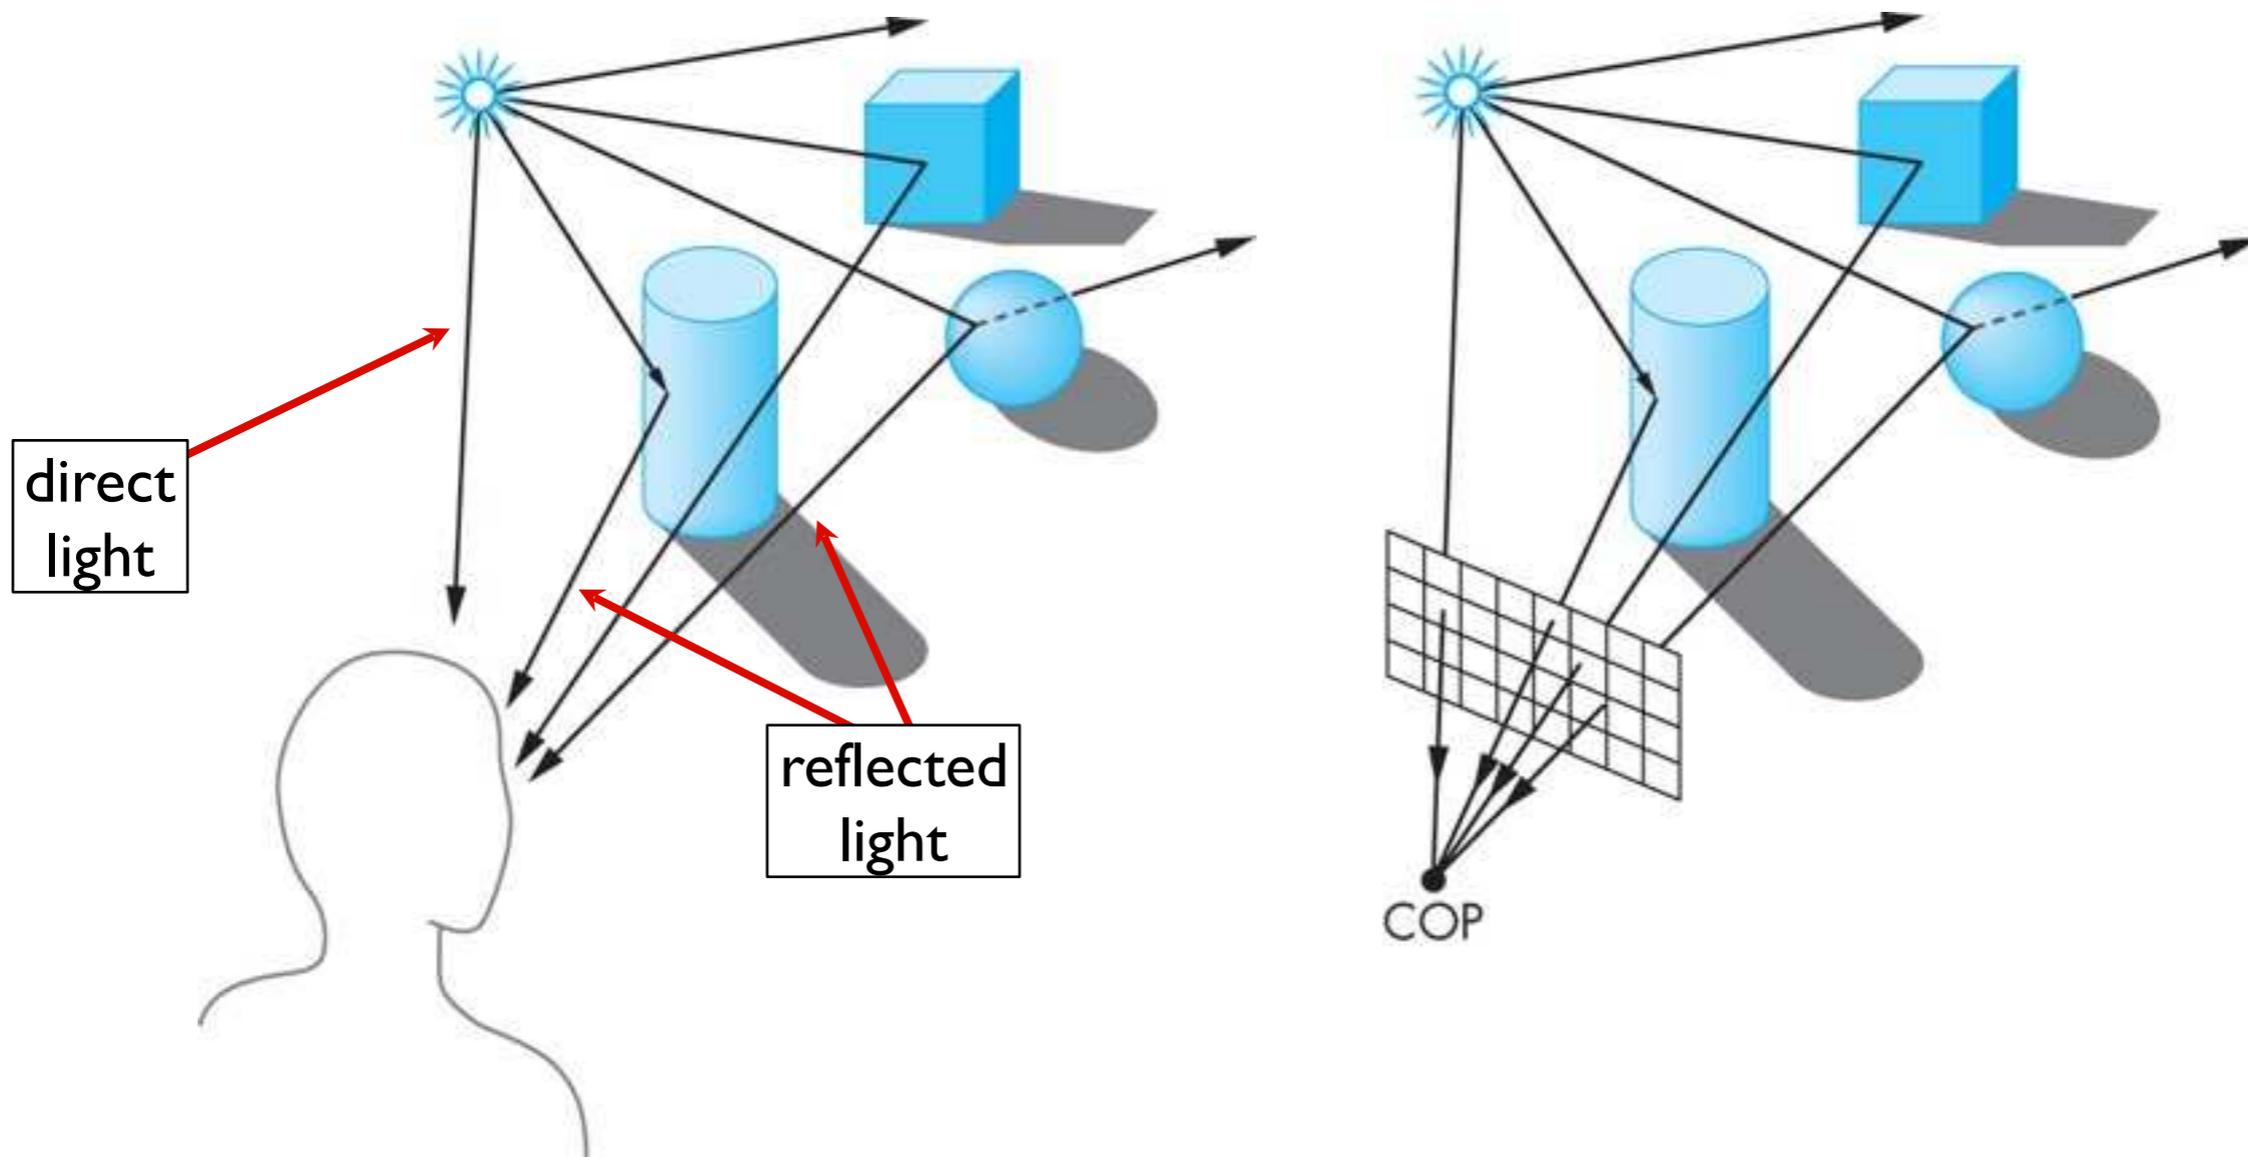

- The most general approach is based on physics - using principles such as conservation of energy
- a surface **emits** light (e.g., light bulb) or **reflects** light from other illumination sources, or both
- light interaction with materials is **recursive**
- the **rendering equation** is an integral equation describing the limit of this recursive process

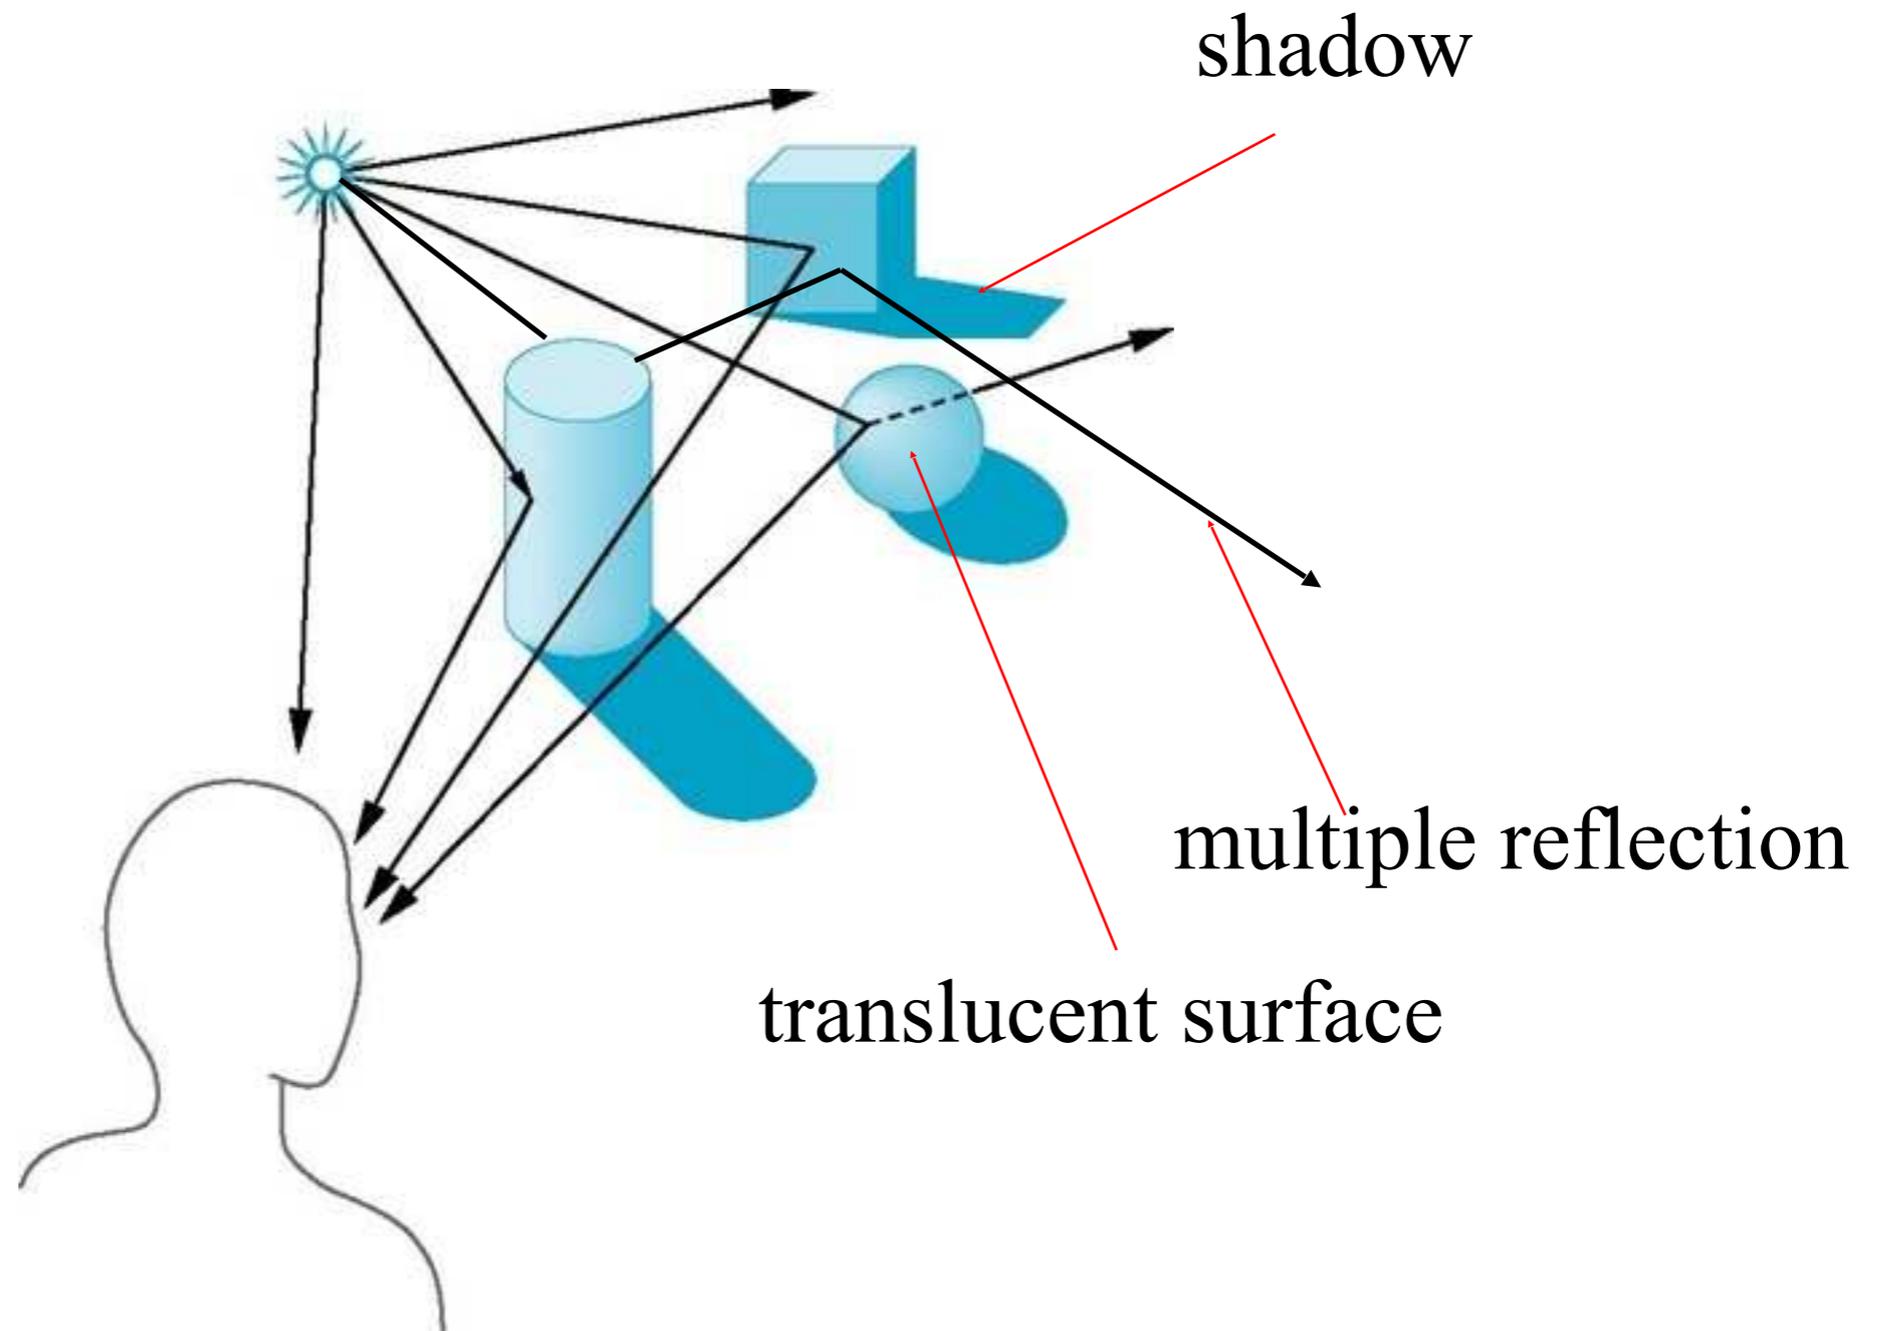

Fast local shading models

- the rendering equation can't be solved analytically
- numerical methods aren't fast enough for real-time
- for our fast graphics rendering pipeline, we'll use a **local** model where shade at a point is independent of other surfaces
- use **Phong reflection model**
 - shading based on local light-material interactions

Local shading model

Global Effects

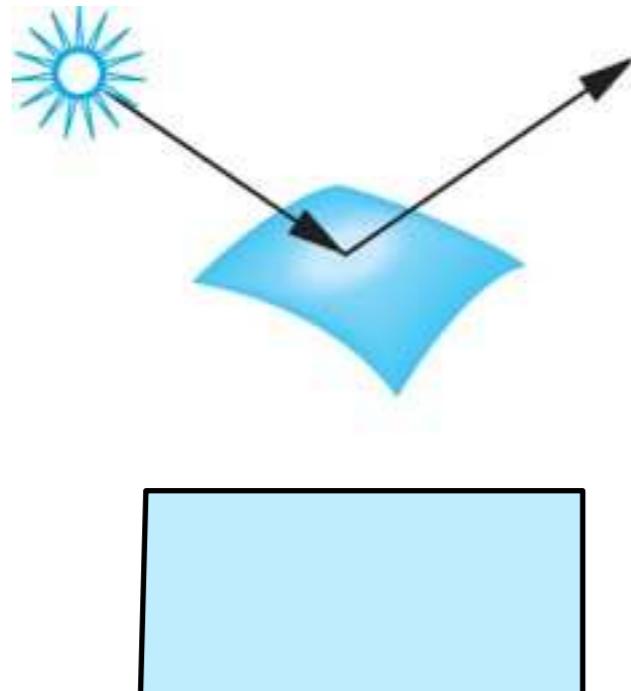

[Angel and Shreiner]

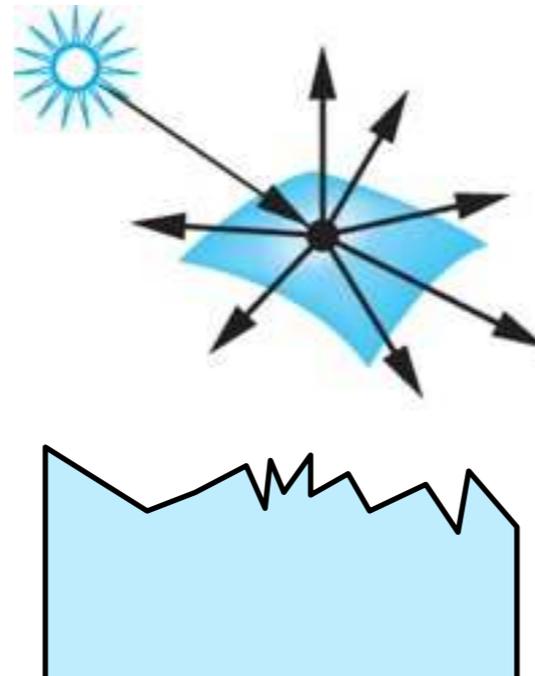

Light-material interactions

at a surface, light is absorbed, reflected, or transmitted

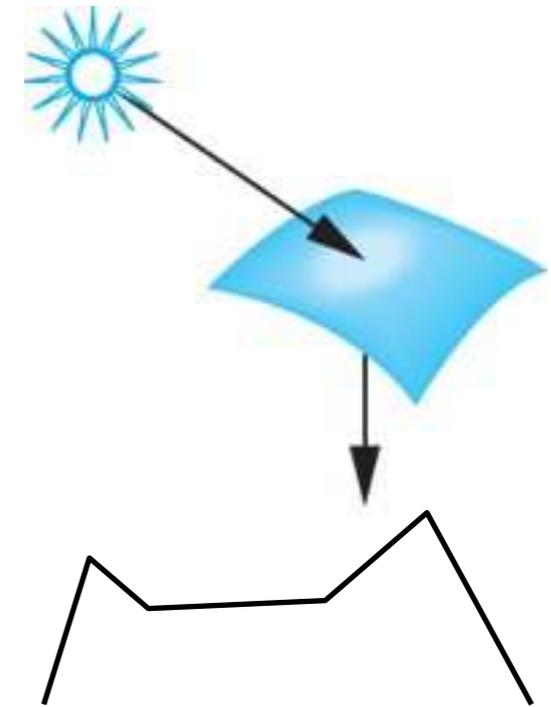

specular

diffuse

translucent

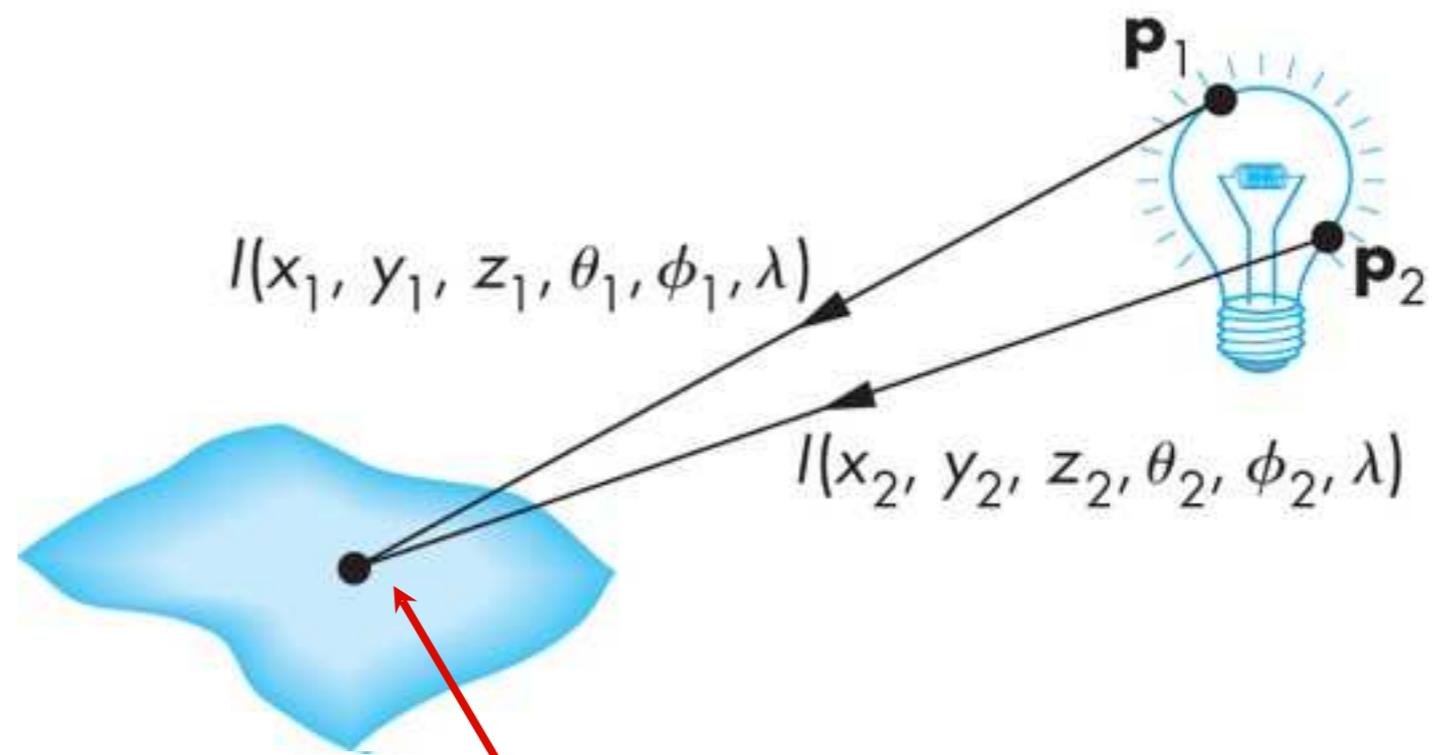

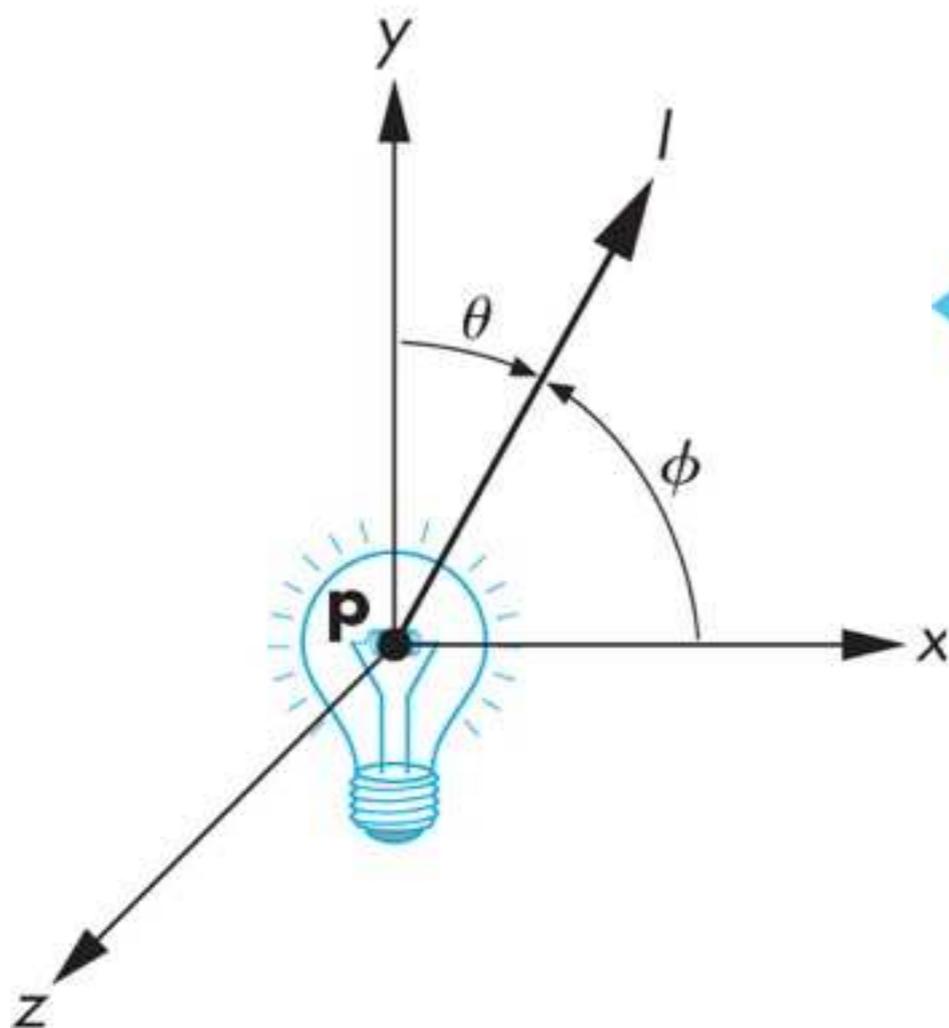

Lights

General light source

Illumination function:

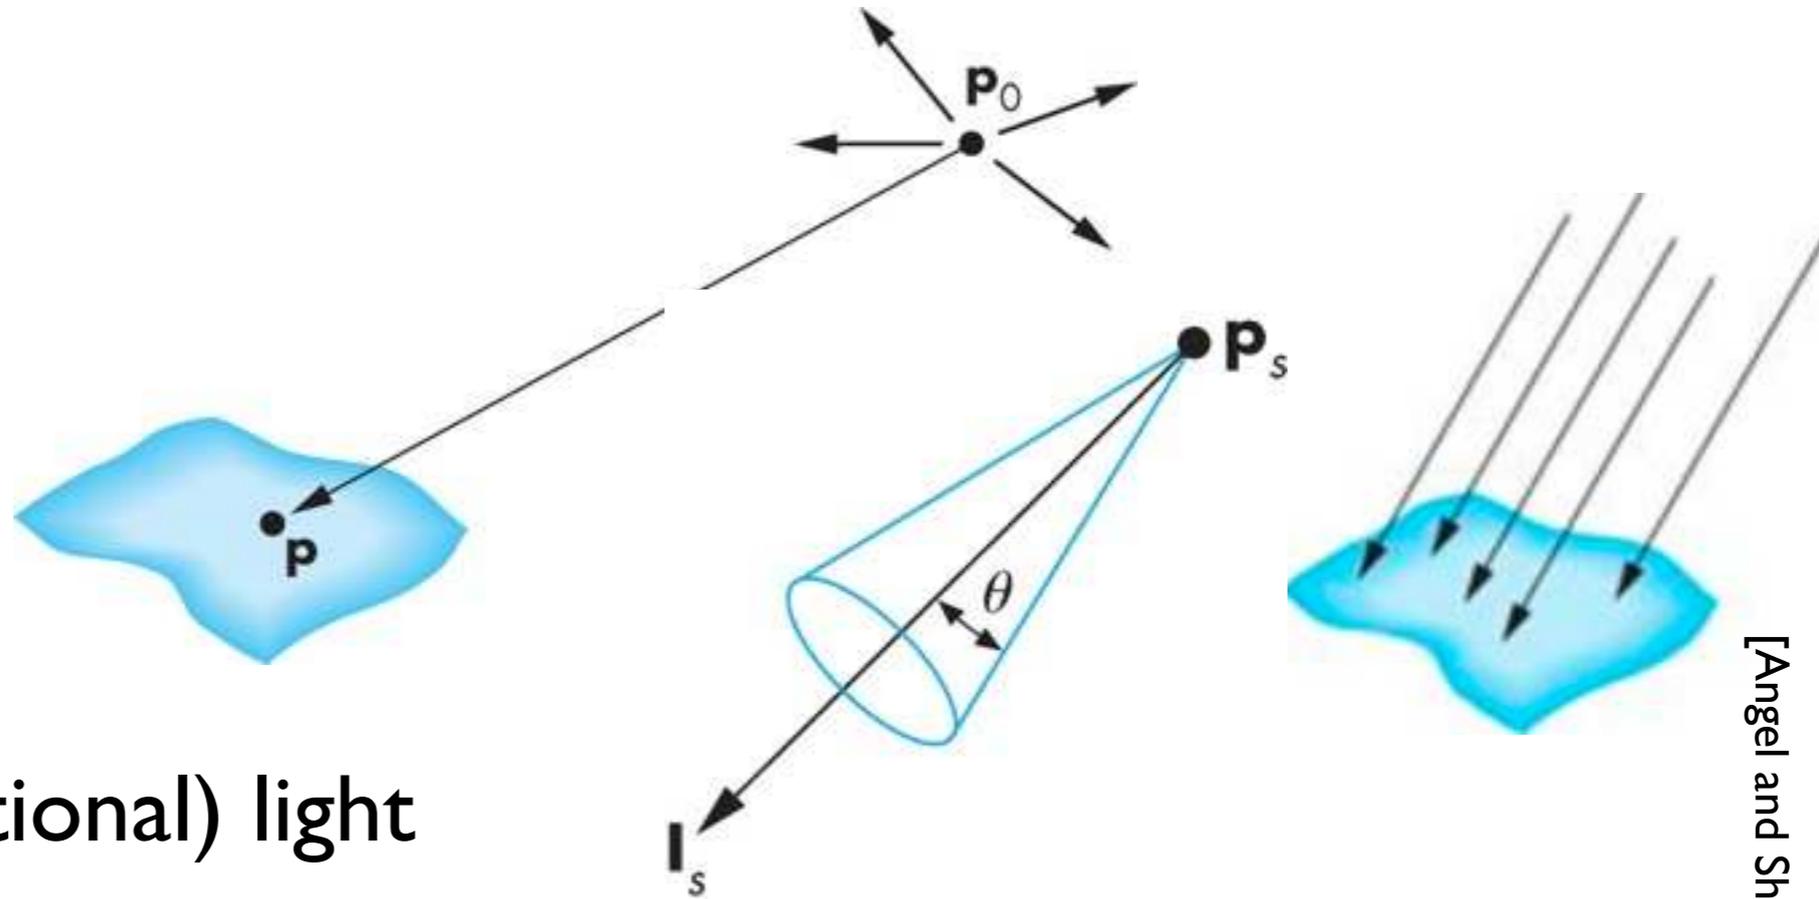

$$l(x, y, z, \theta, \phi, \lambda)$$

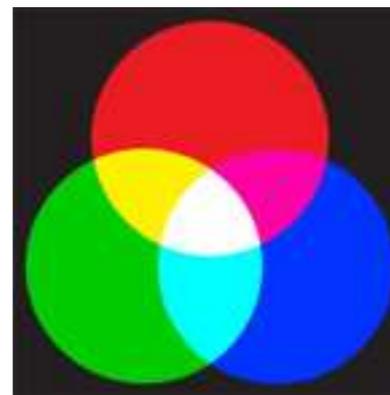

integrate contributions from all sources to shade the point

Idealized light sources

- Ambient light
- Point light
- Spotlight
- distant (directional) light

luminance: $\mathbf{L} = \begin{bmatrix} L_r \\ L_g \\ L_b \end{bmatrix}$

Ambient light source

- achieve a uniform light level
- no black shadows
- ambient light intensity at each point in the scene

$$\mathbf{L}_a = \begin{bmatrix} L_{ar} \\ L_{ag} \\ L_{ab} \end{bmatrix}$$

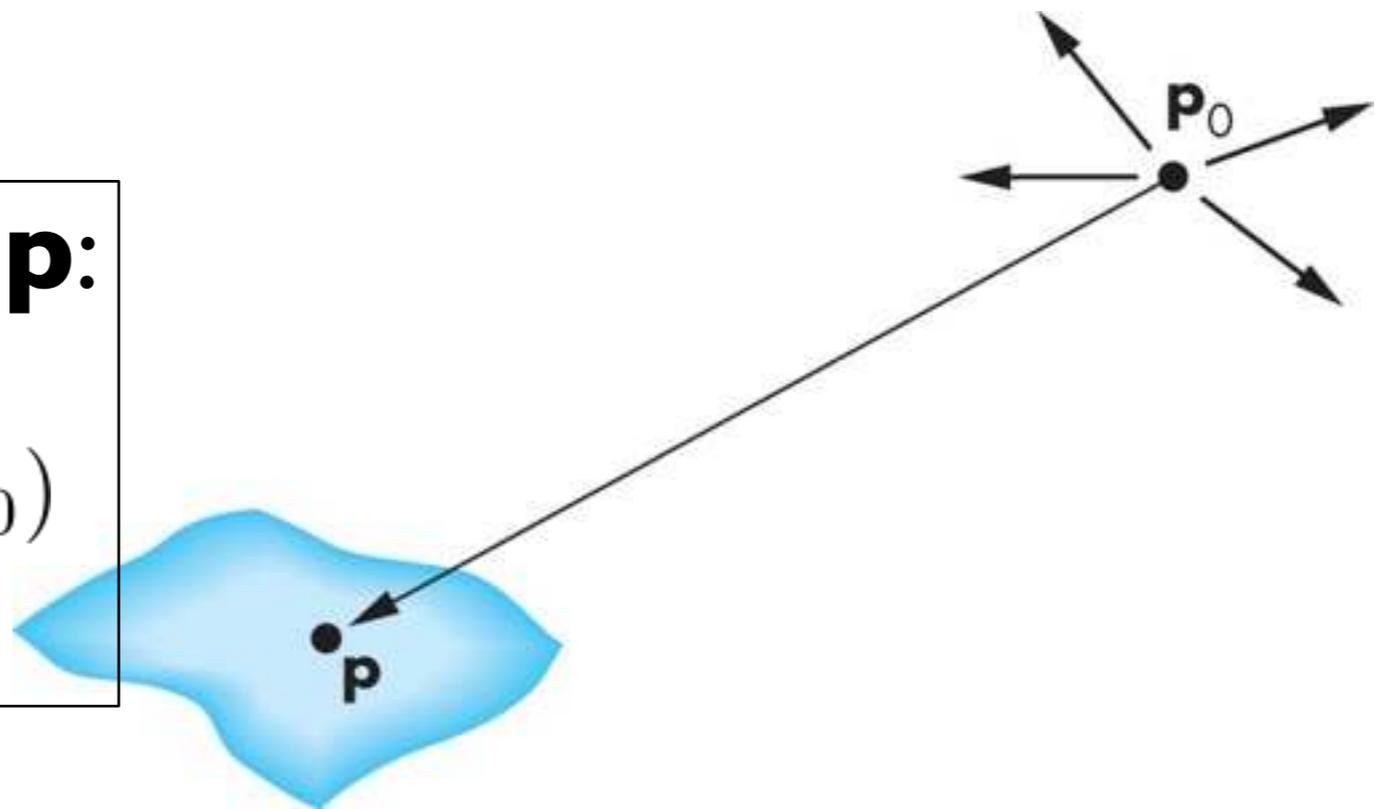

$$L_a$$

Point light source

$$\mathbf{L}(\mathbf{p}_0) = \begin{bmatrix} L_r(\mathbf{p}_0) \\ L_g(\mathbf{p}_0) \\ L_b(\mathbf{p}_0) \end{bmatrix} \quad L(\mathbf{p}_0)$$

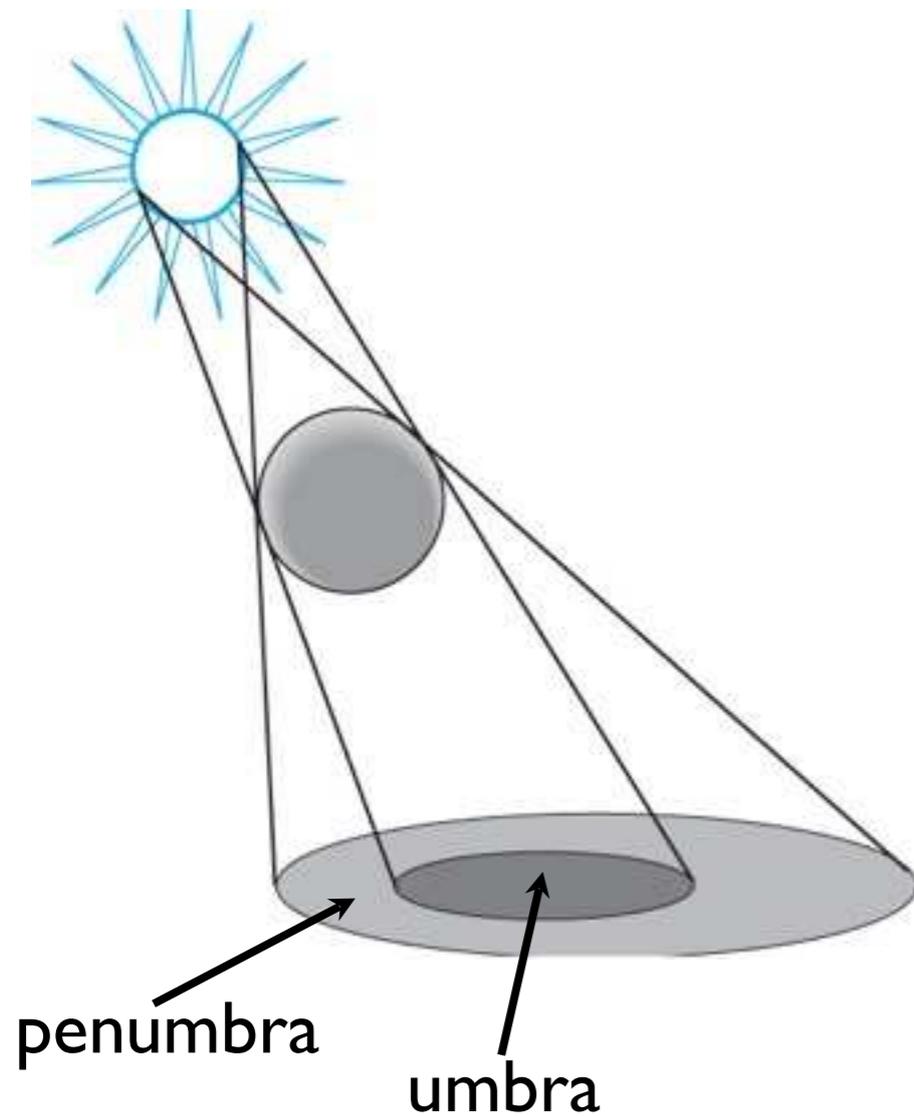

illumination intensity at \mathbf{p} :

$$l(\mathbf{p}, \mathbf{p}_0) = \frac{1}{|\mathbf{p} - \mathbf{p}_0|^2} \mathbf{L}(\mathbf{p}_0)$$

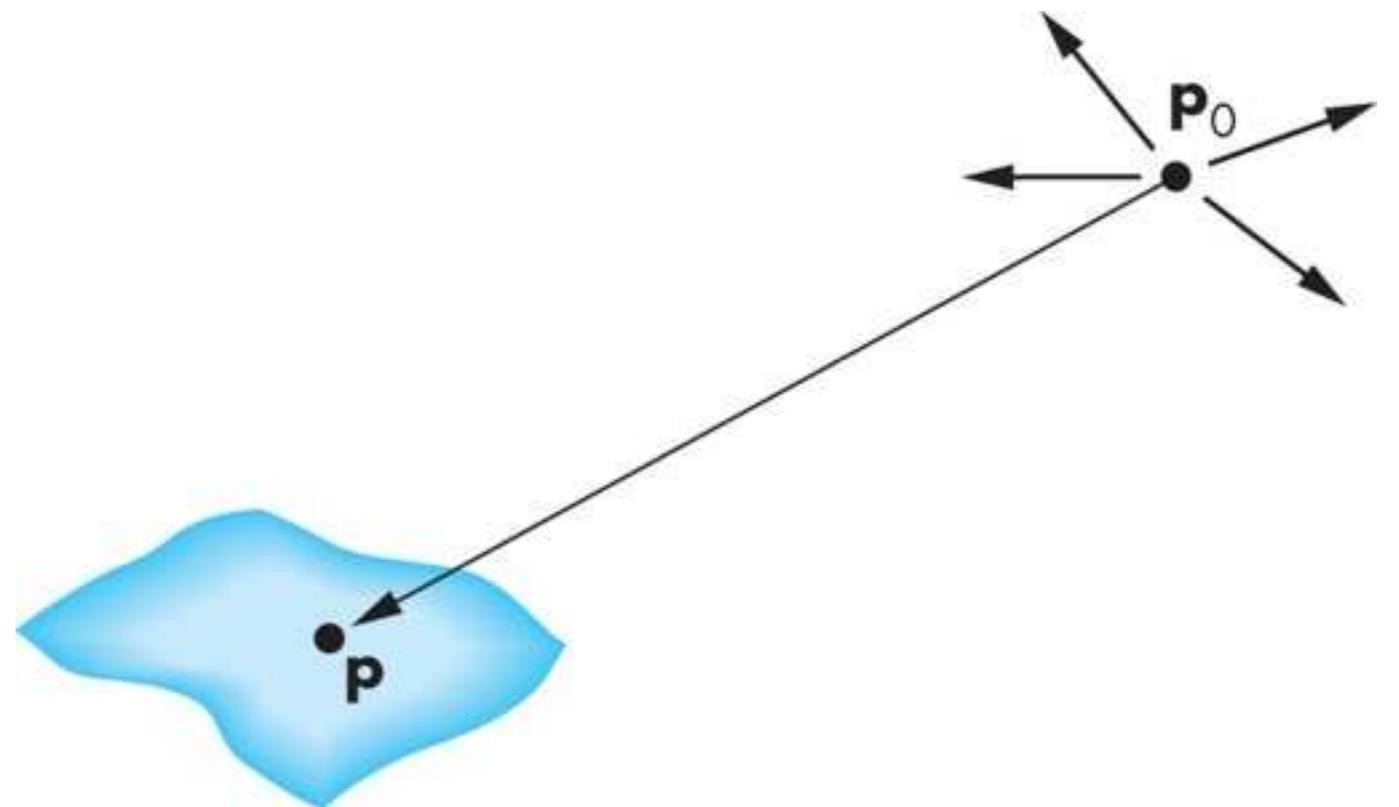

Point light source

Most real-world scenes have large light sources

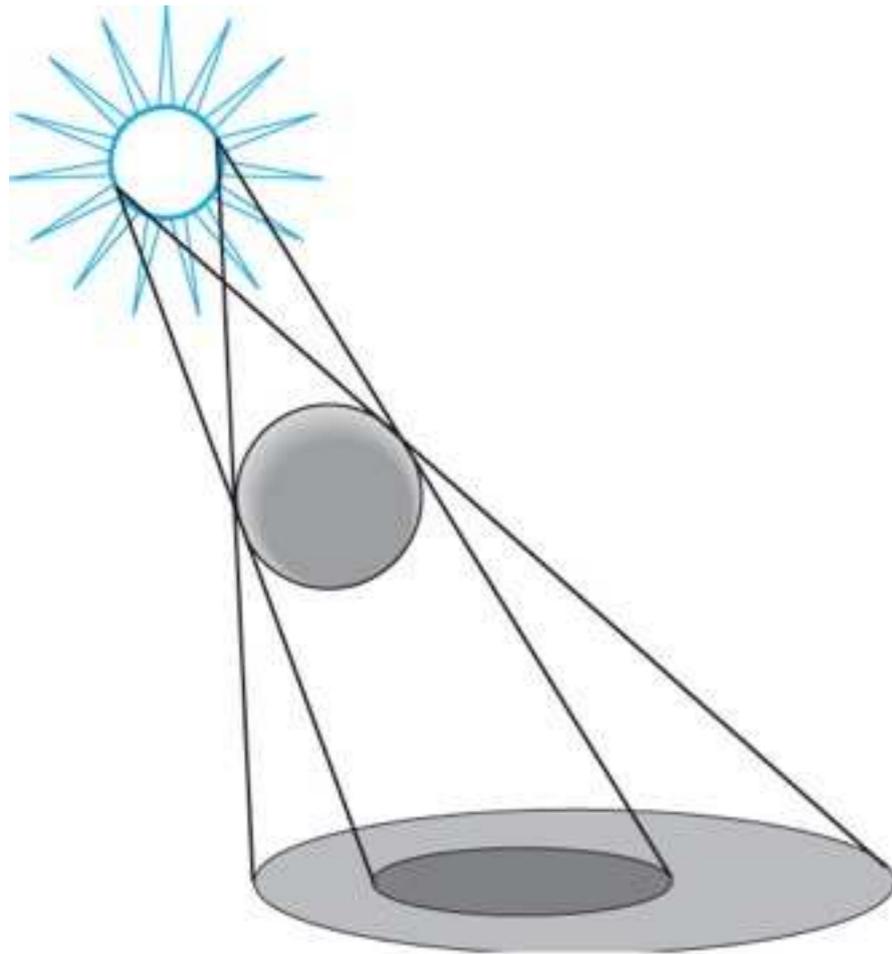

Point light sources alone aren't too realistic - **add ambient light to mitigate high contrast**

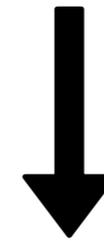

Point light source

Most real-world scenes have large light sources

Point light sources alone aren't too realistic
- **drop off intensity more slowly**

$$l(\mathbf{p}, \mathbf{p}_0) = \frac{1}{d^2} \mathbf{L}(\mathbf{p}_0)$$

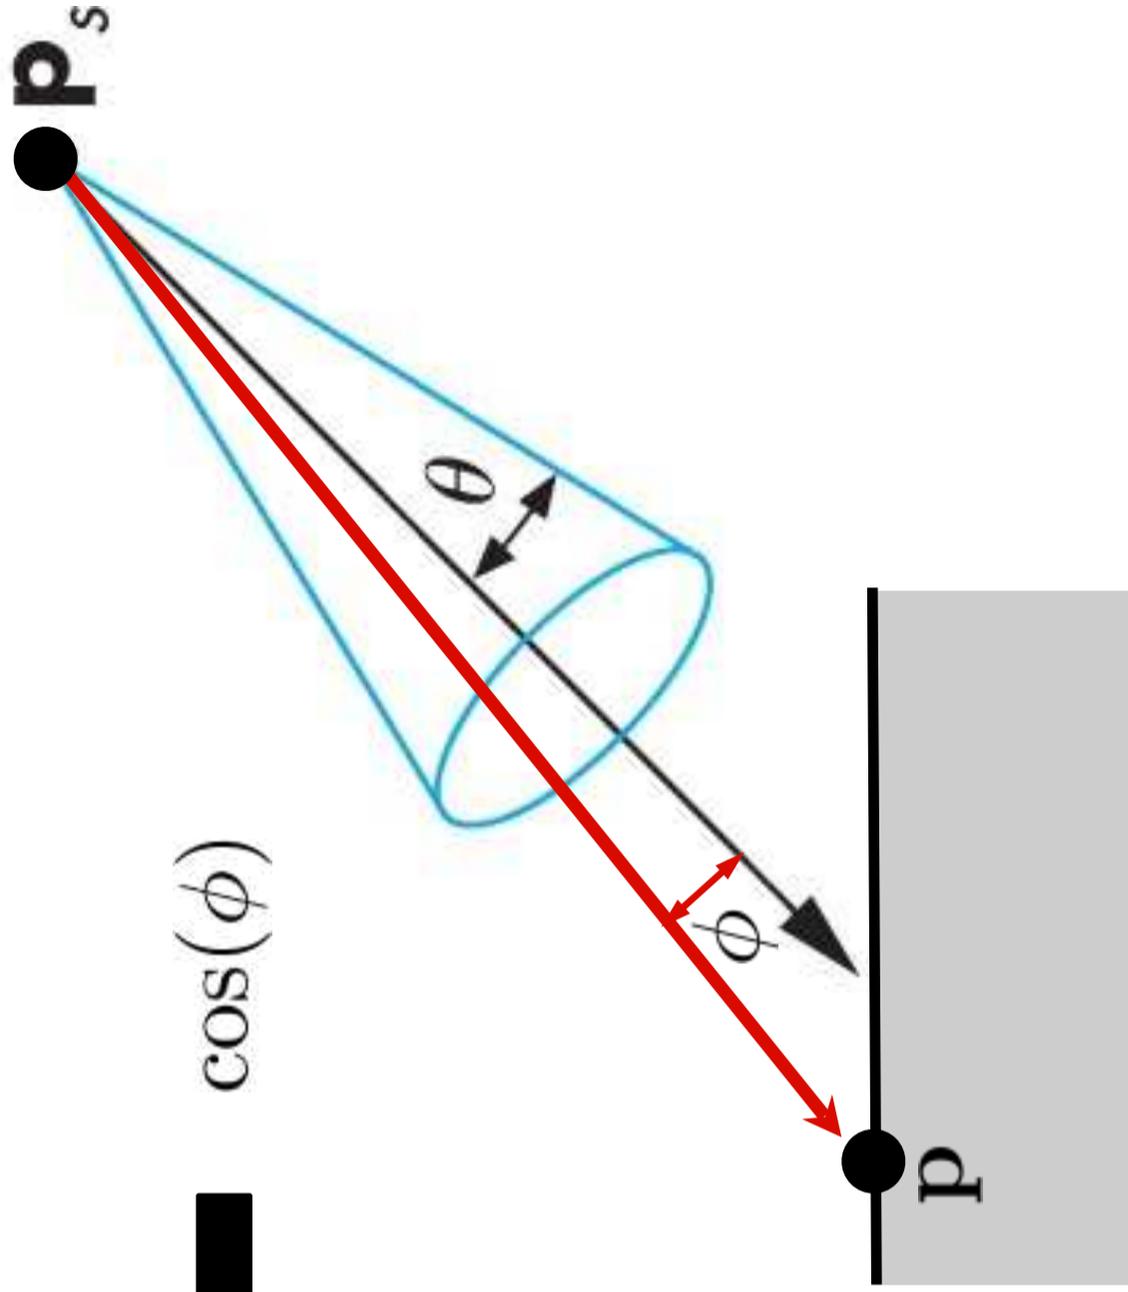

$$l(\mathbf{p}, \mathbf{p}_0) = \frac{1}{a + bd + cd^2} \mathbf{L}(\mathbf{p}_0)$$

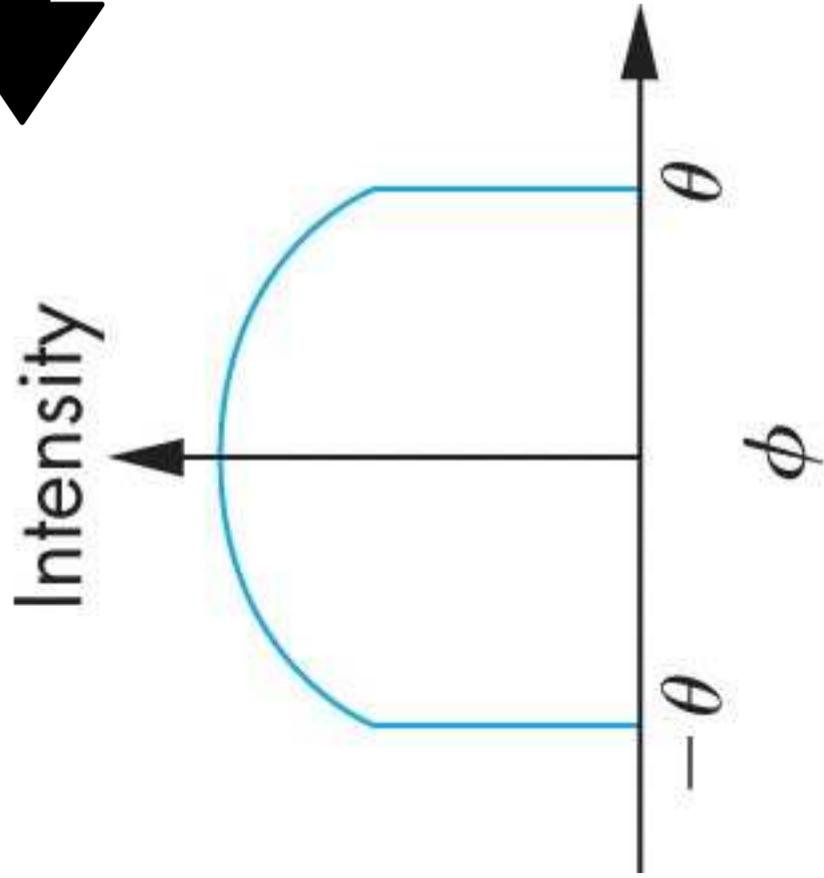

[Angel and Shreiner]

(We will do the right thing for the raytracing project)

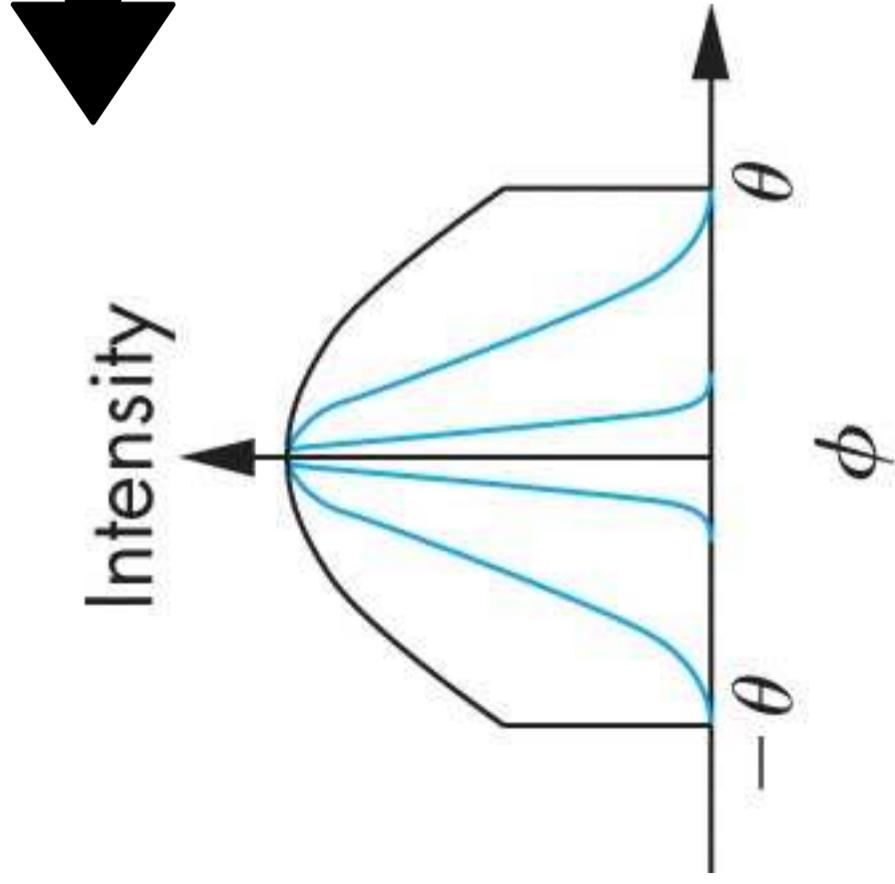

Spotlights

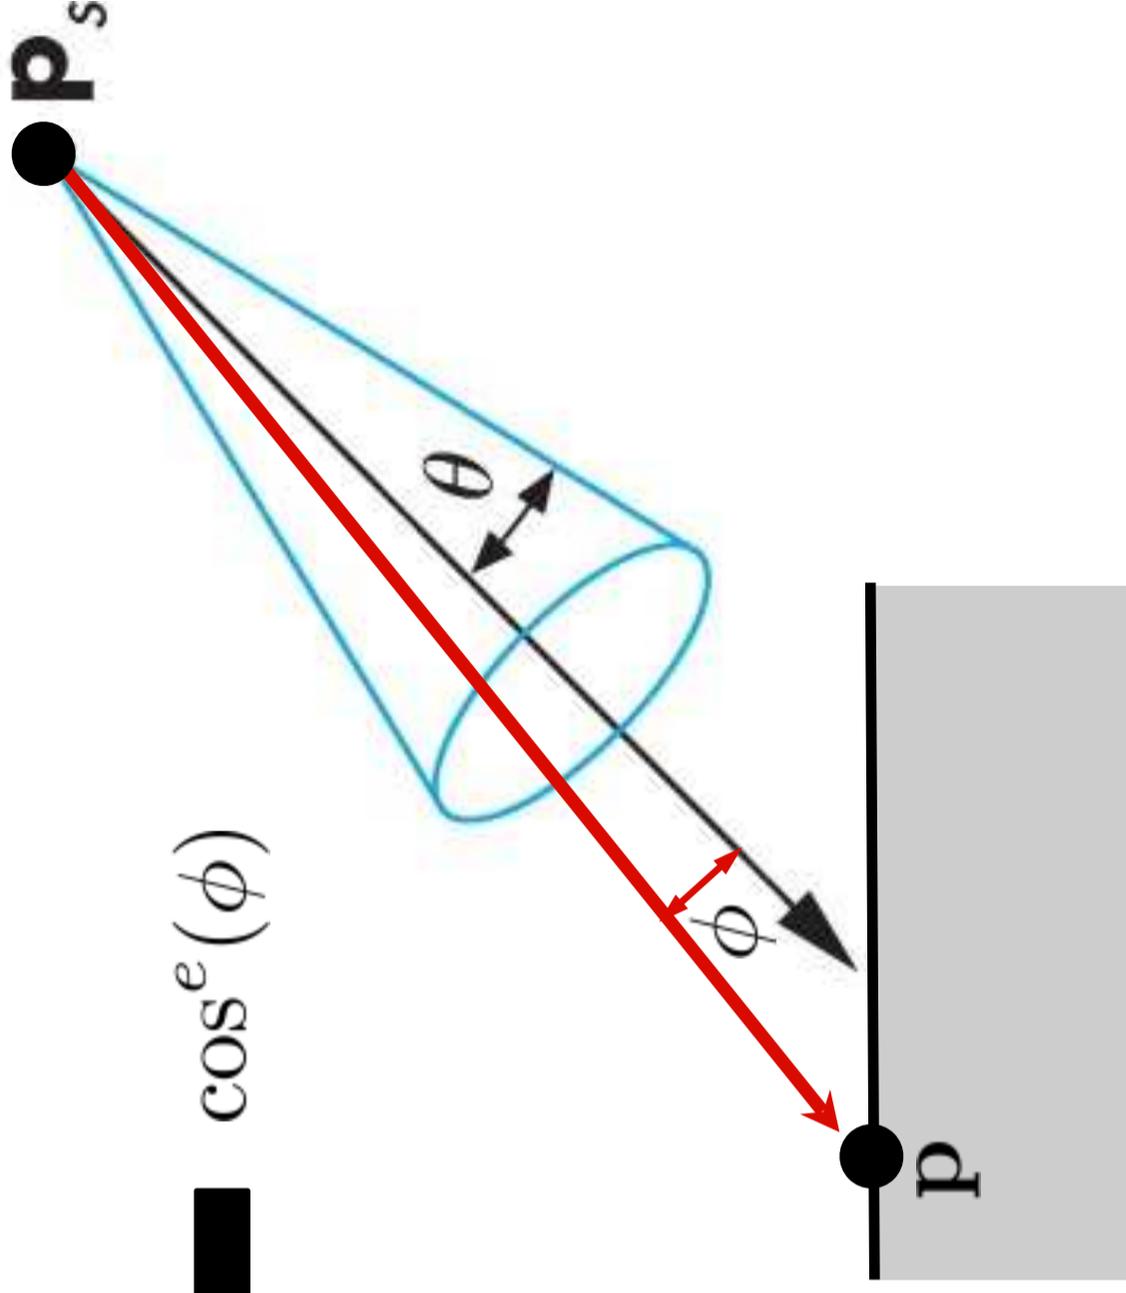

$\cos(\phi)$

Spotlights

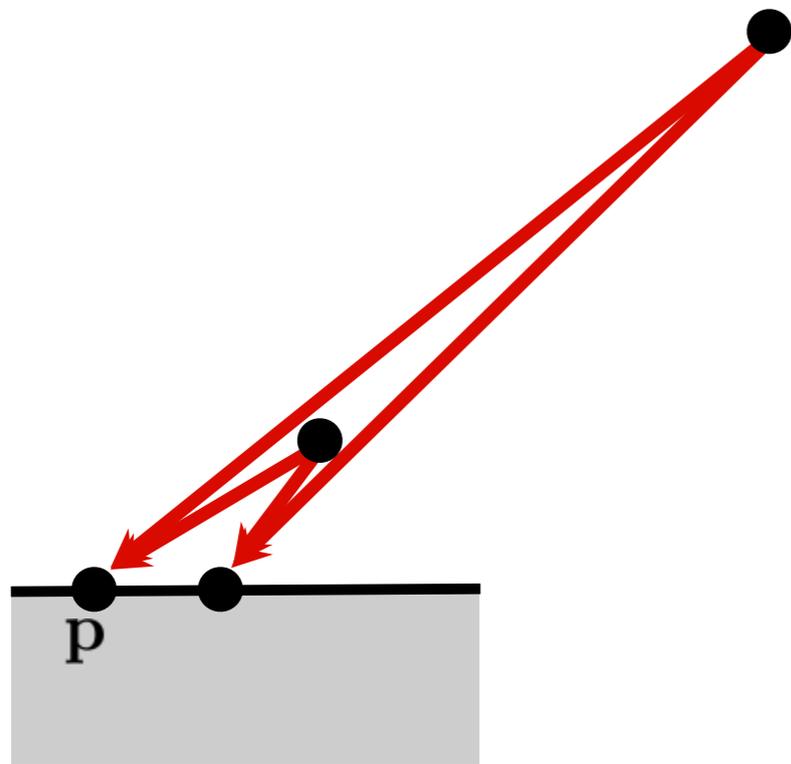

$\cos^e(\phi)$

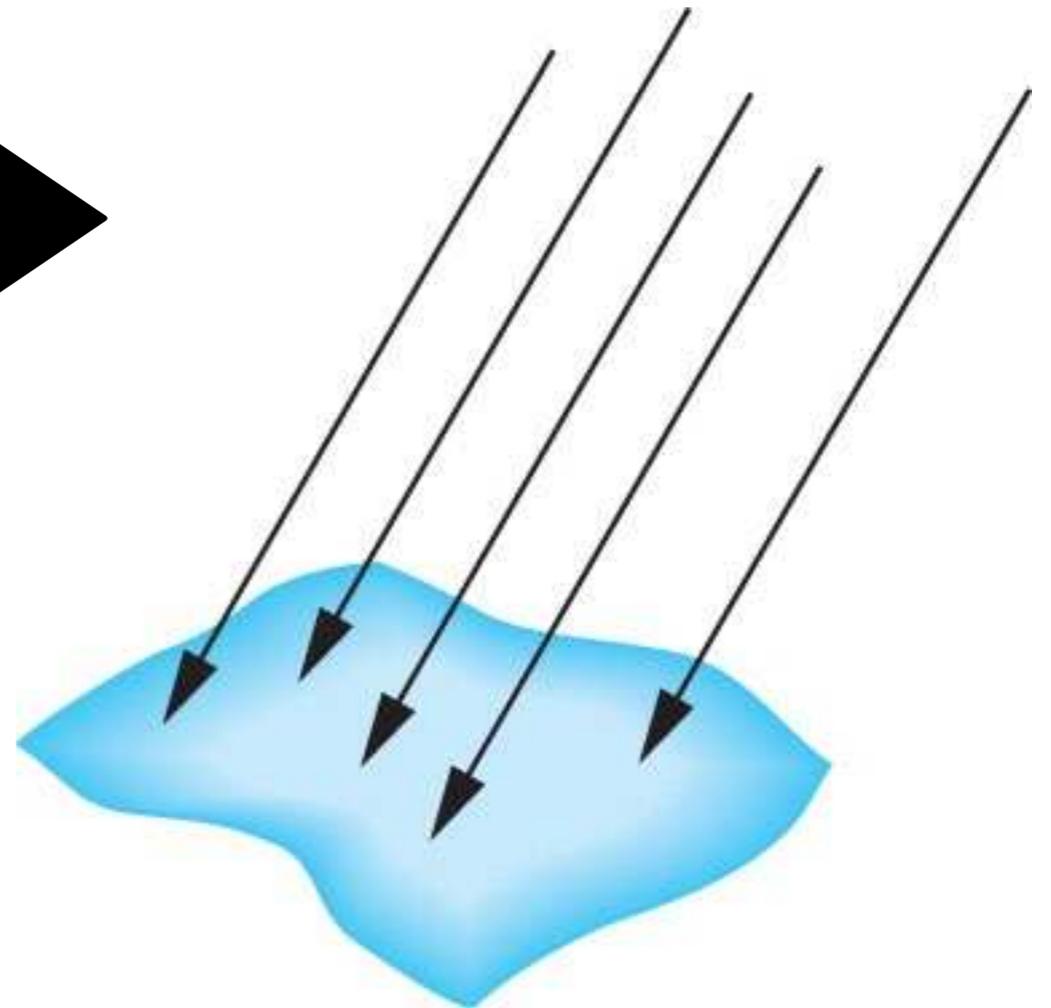

$$\cos^e(\phi) l(\mathbf{p}, \mathbf{p}_s)$$

Distant light source

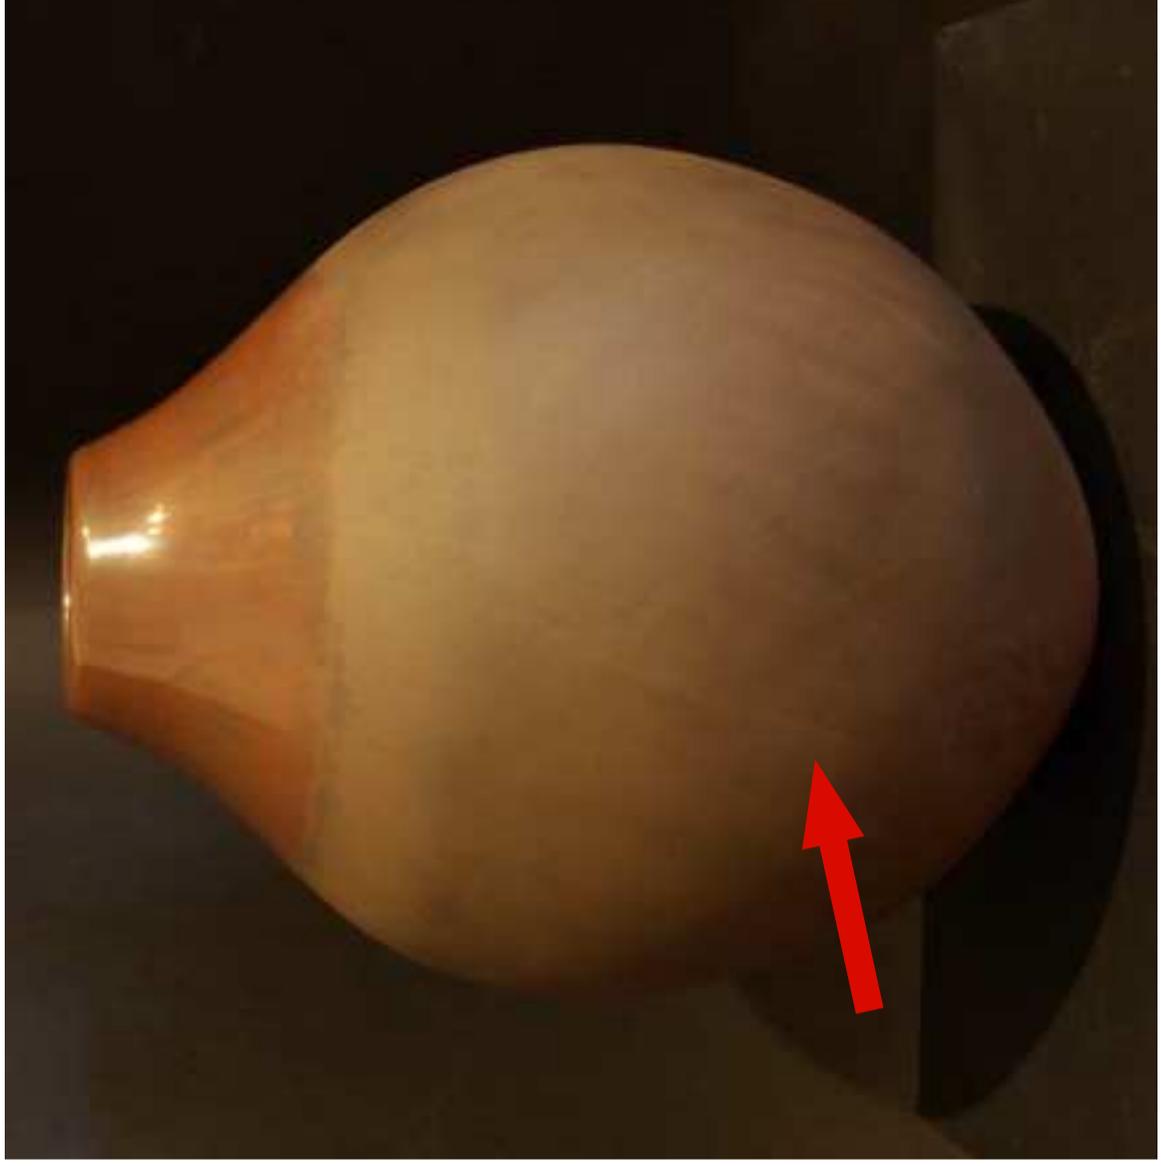

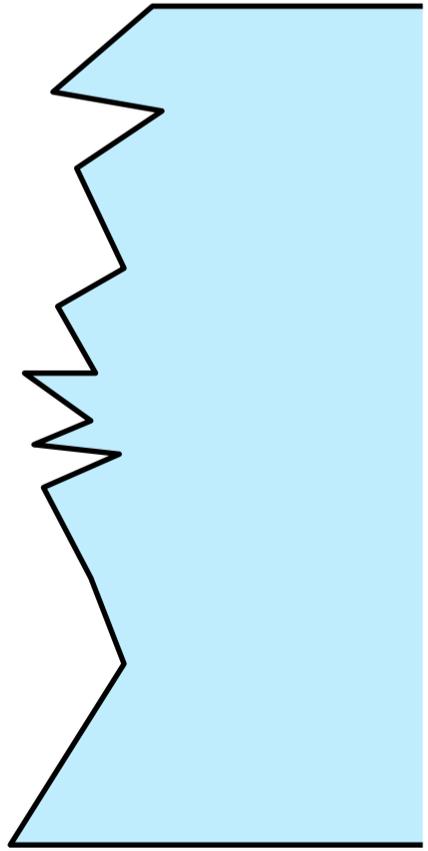

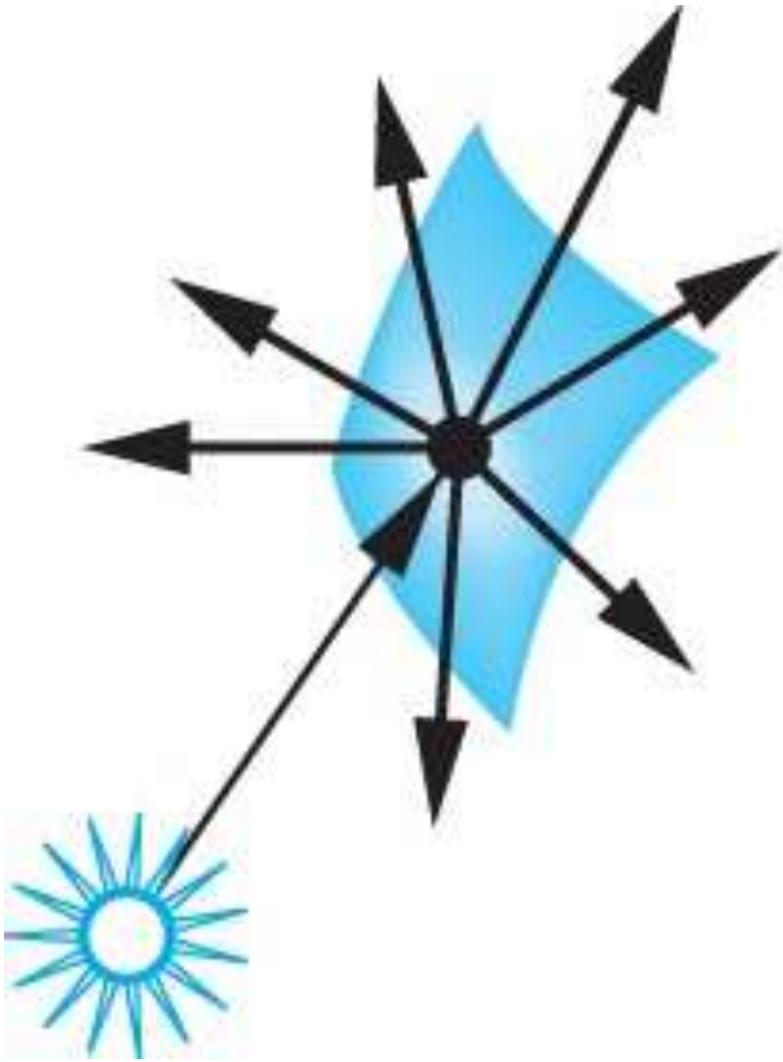

characterized by
direction

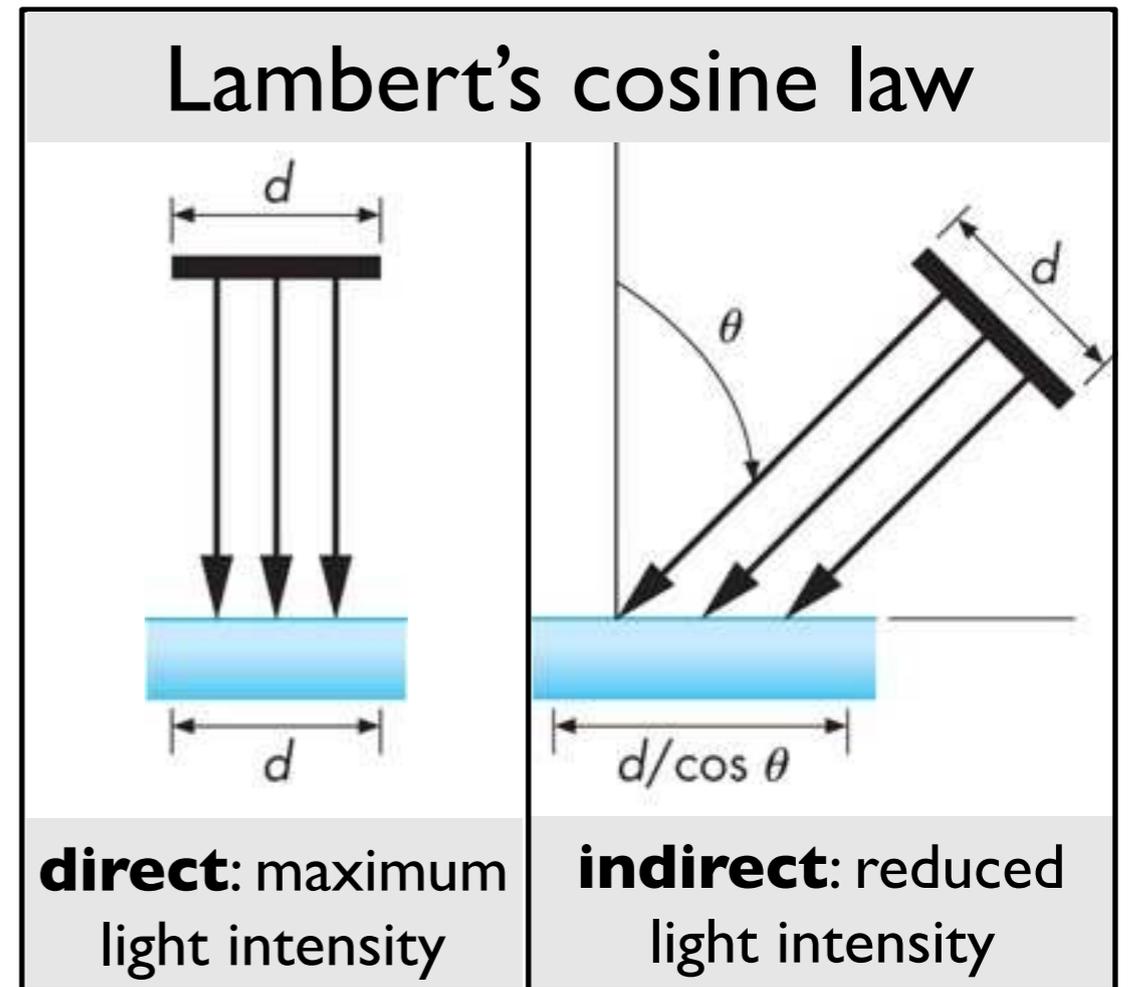

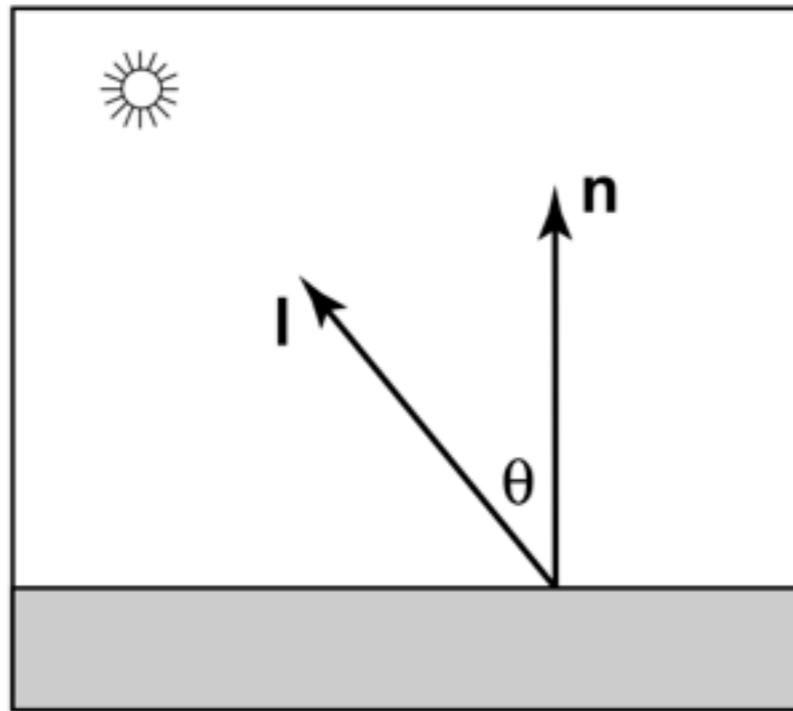

Shading models

Lambertian Reflection Model

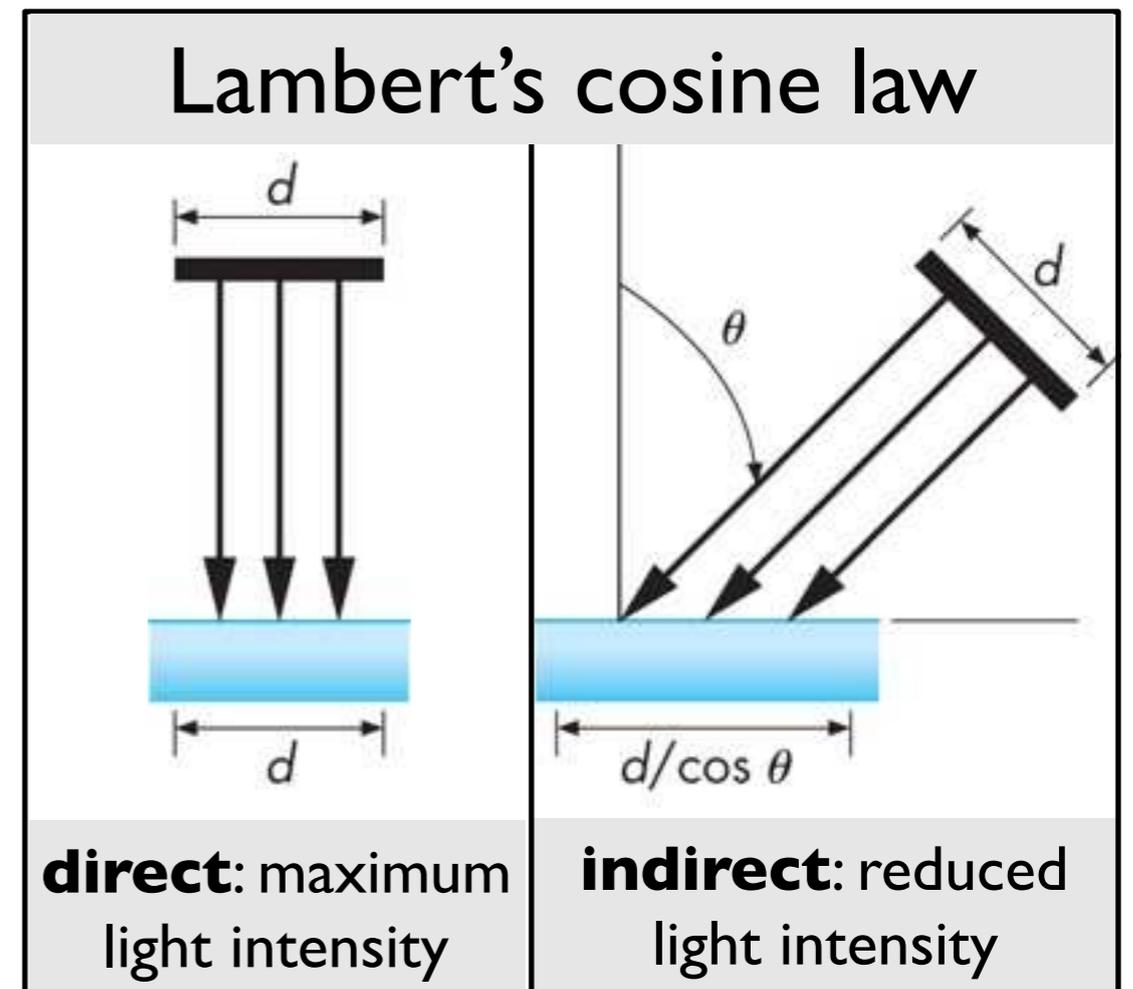

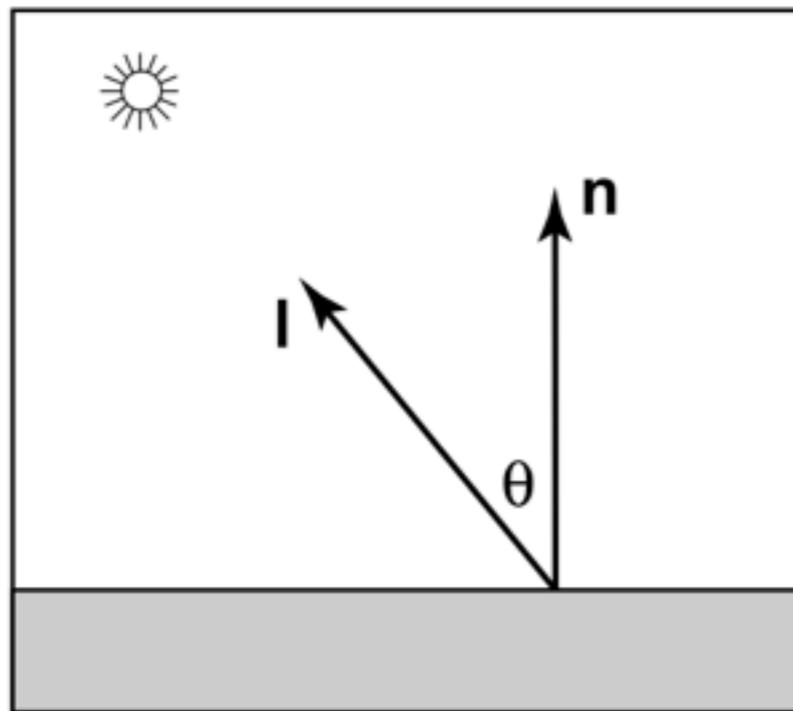

Lambertian Reflection Model

$$I \propto \cos \theta$$

color intensity

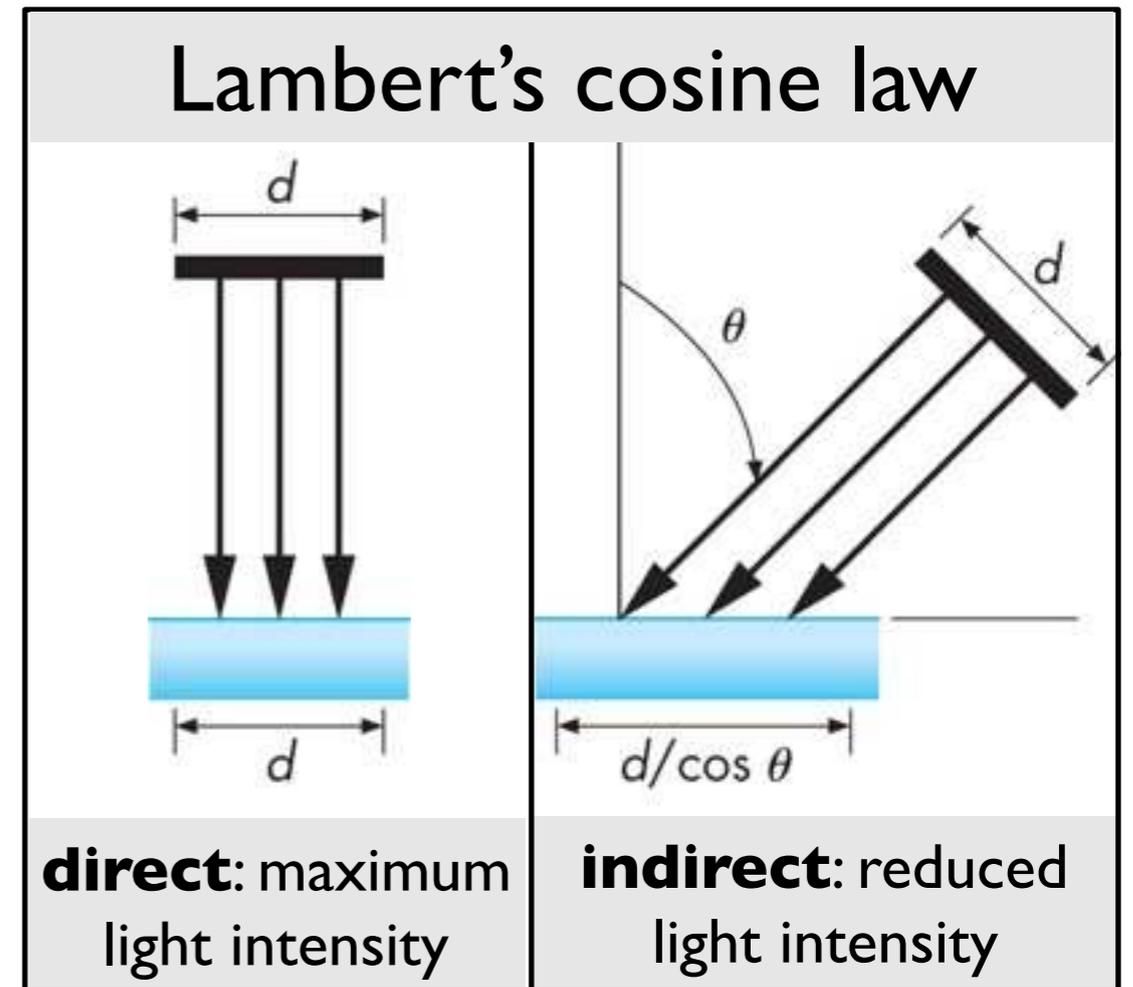

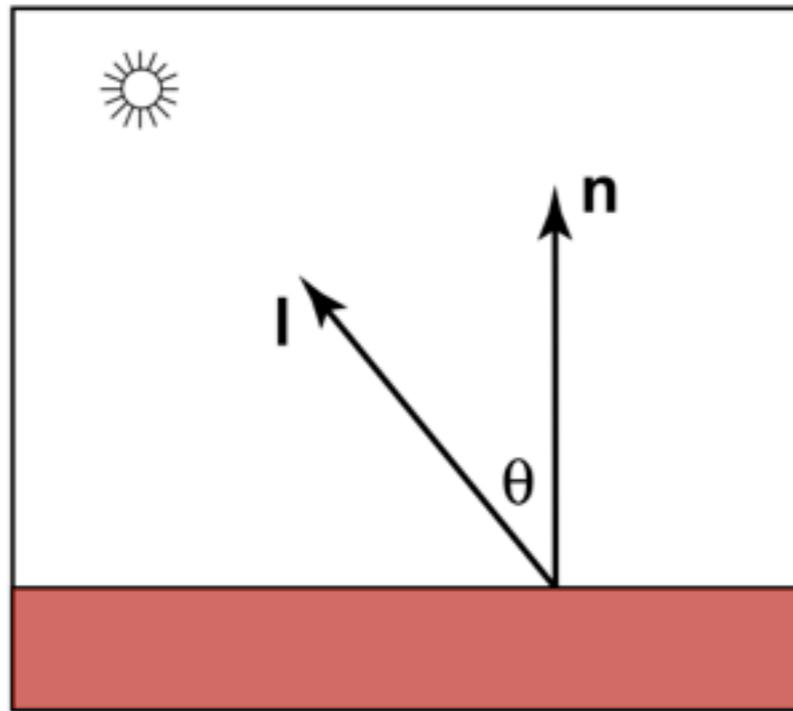

Lambertian Reflection Model

$$I \propto \mathbf{n} \cdot \mathbf{l}$$

color intensity

Lambertian Reflection Model

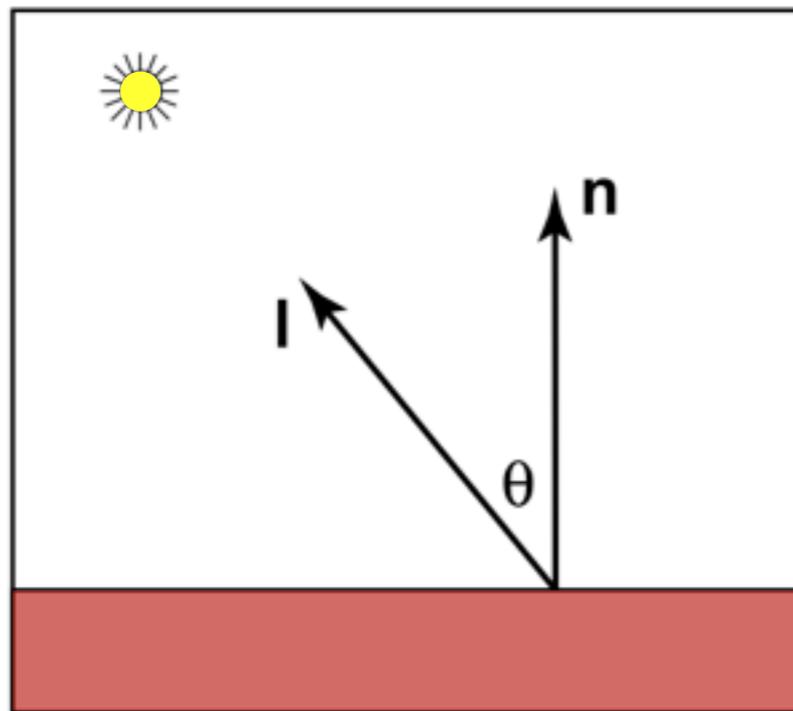

$$I \propto R n \cdot l$$

color intensity

reflectance

Lambertian Reflection Model

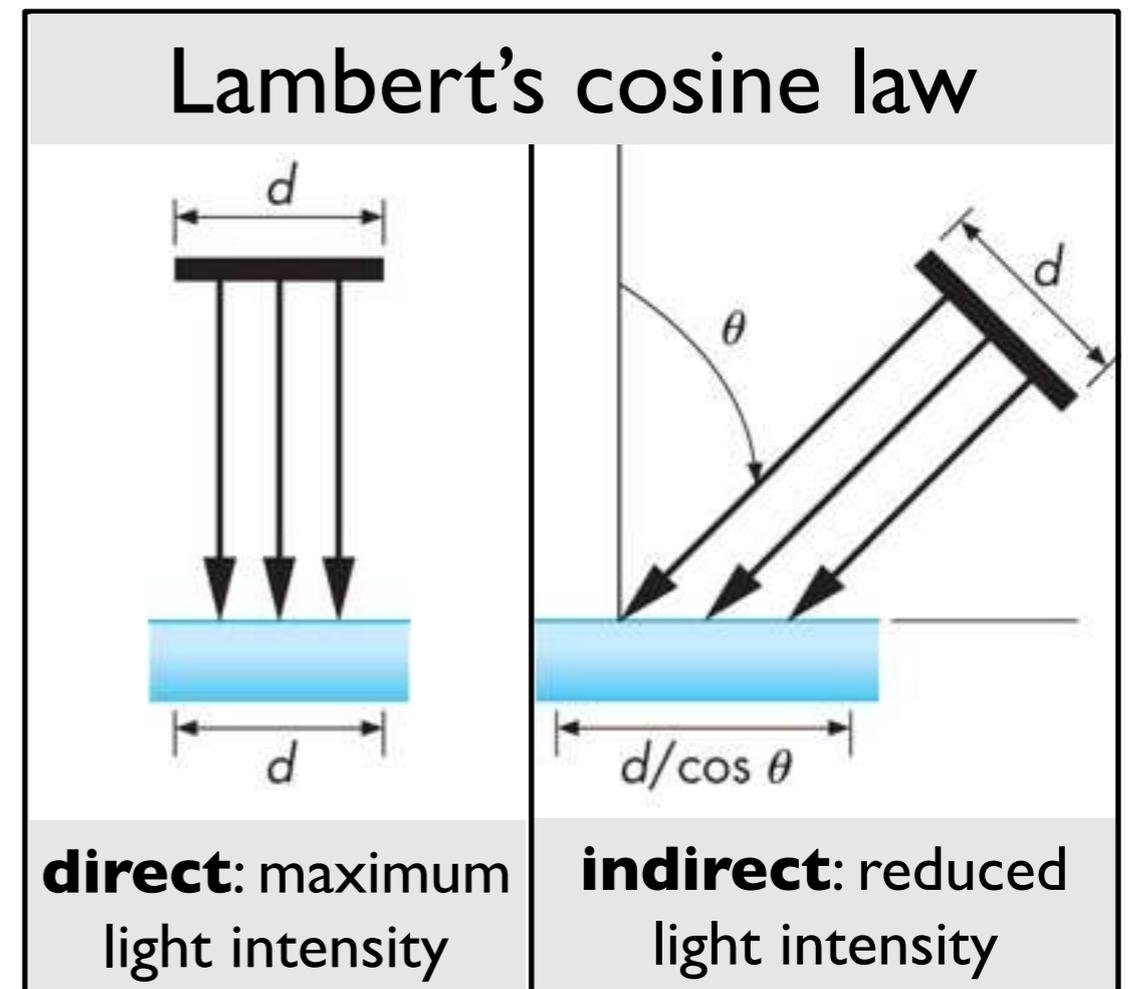

illumination

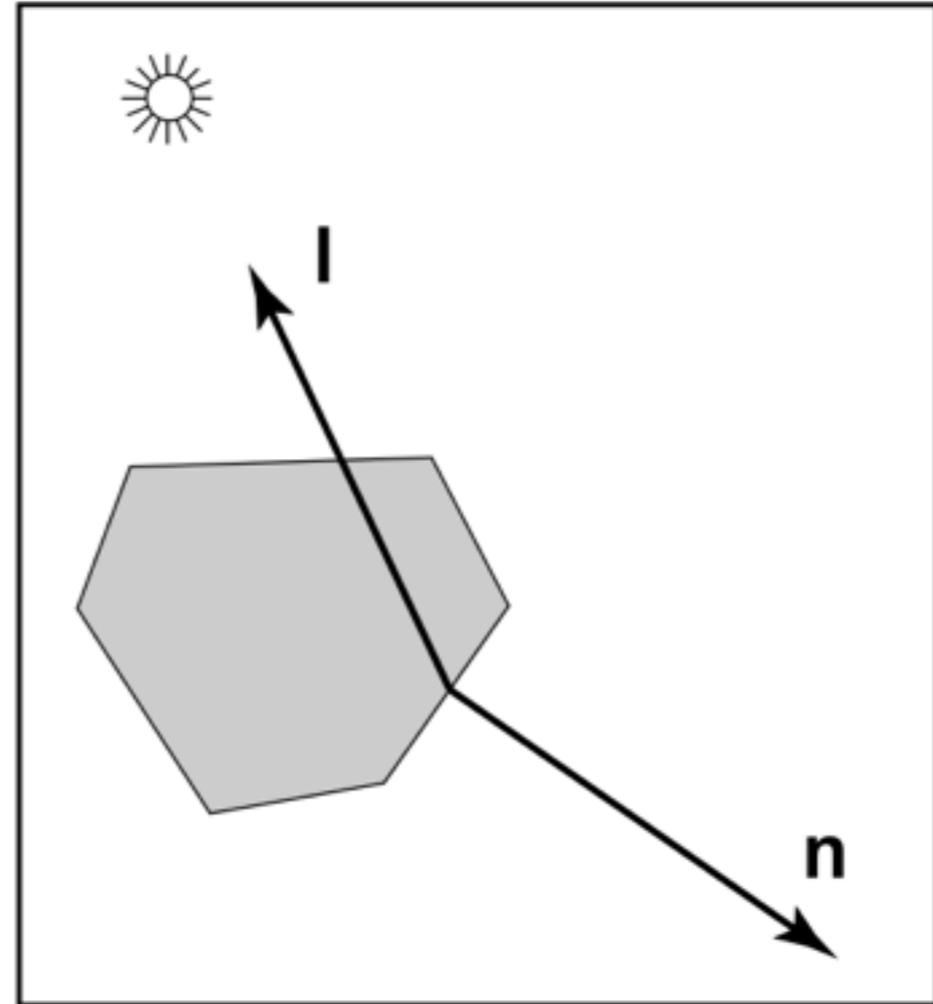

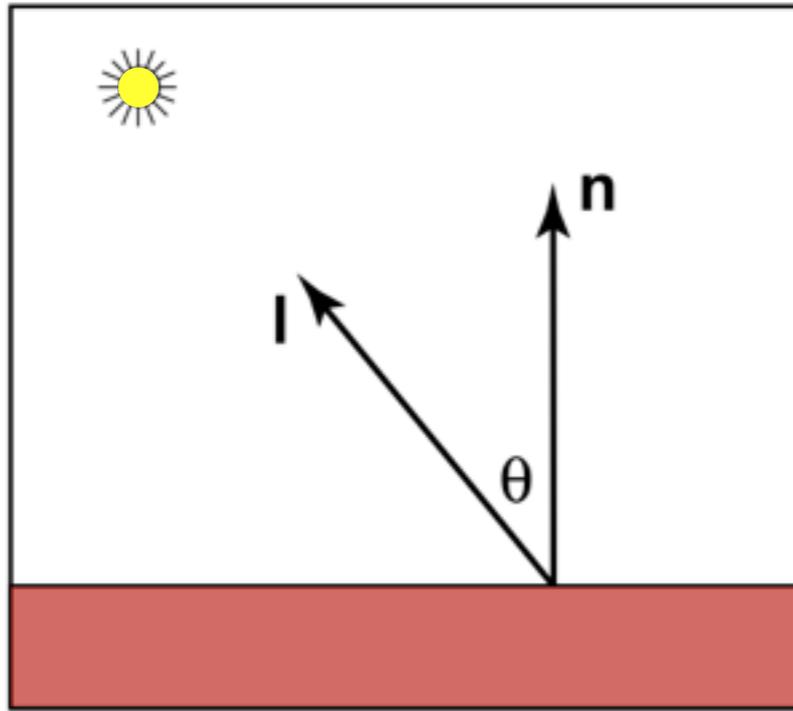

$$I = LR_n \cdot l$$

color intensity

reflectance

Lambertian Reflection Model

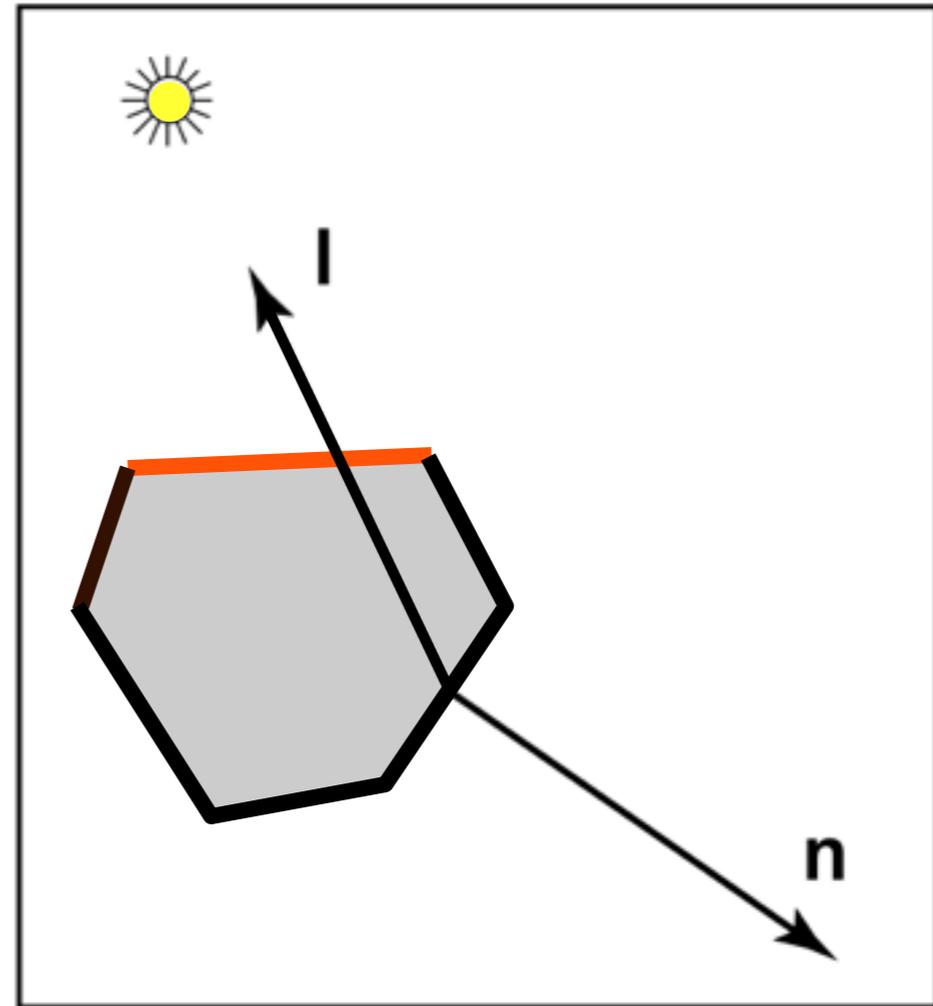

$$I = LR \max(0, \mathbf{n} \cdot \mathbf{l})$$

Ambient Reflection

$$I = LR \max(0, \mathbf{n} \cdot \mathbf{l})$$

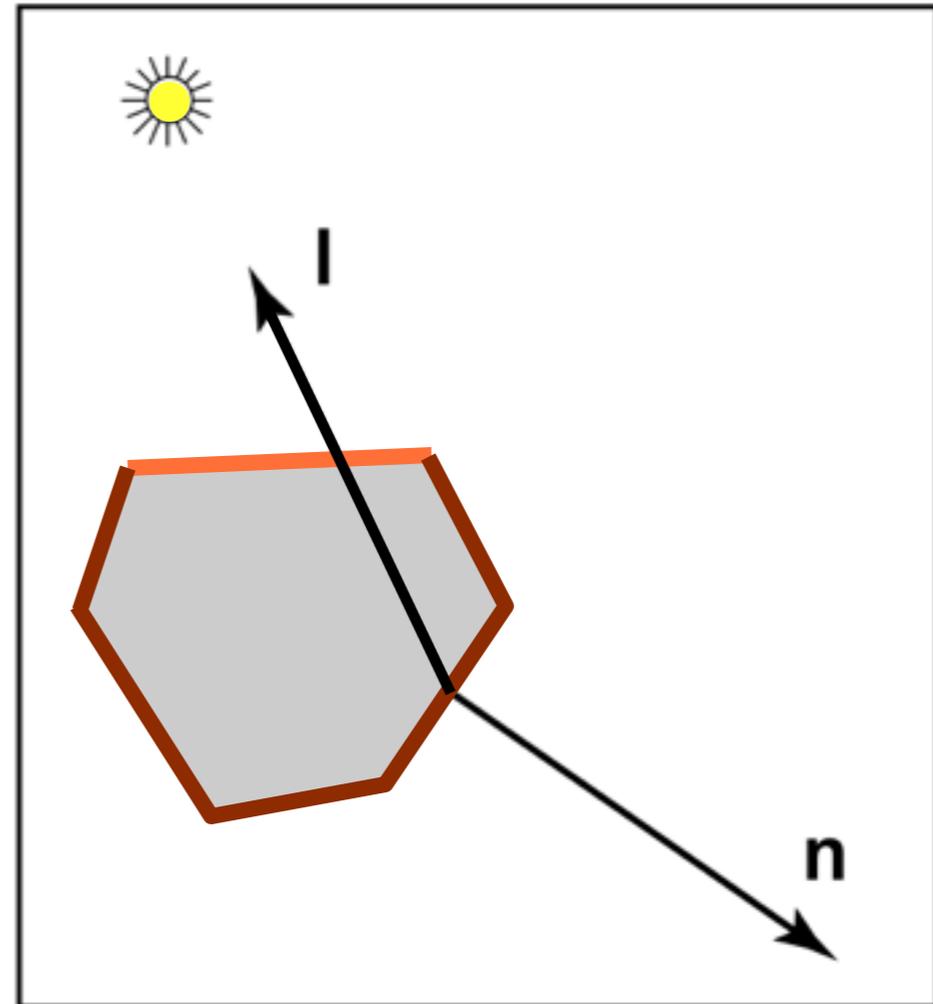

Surfaces facing away from the light will be totally **black**

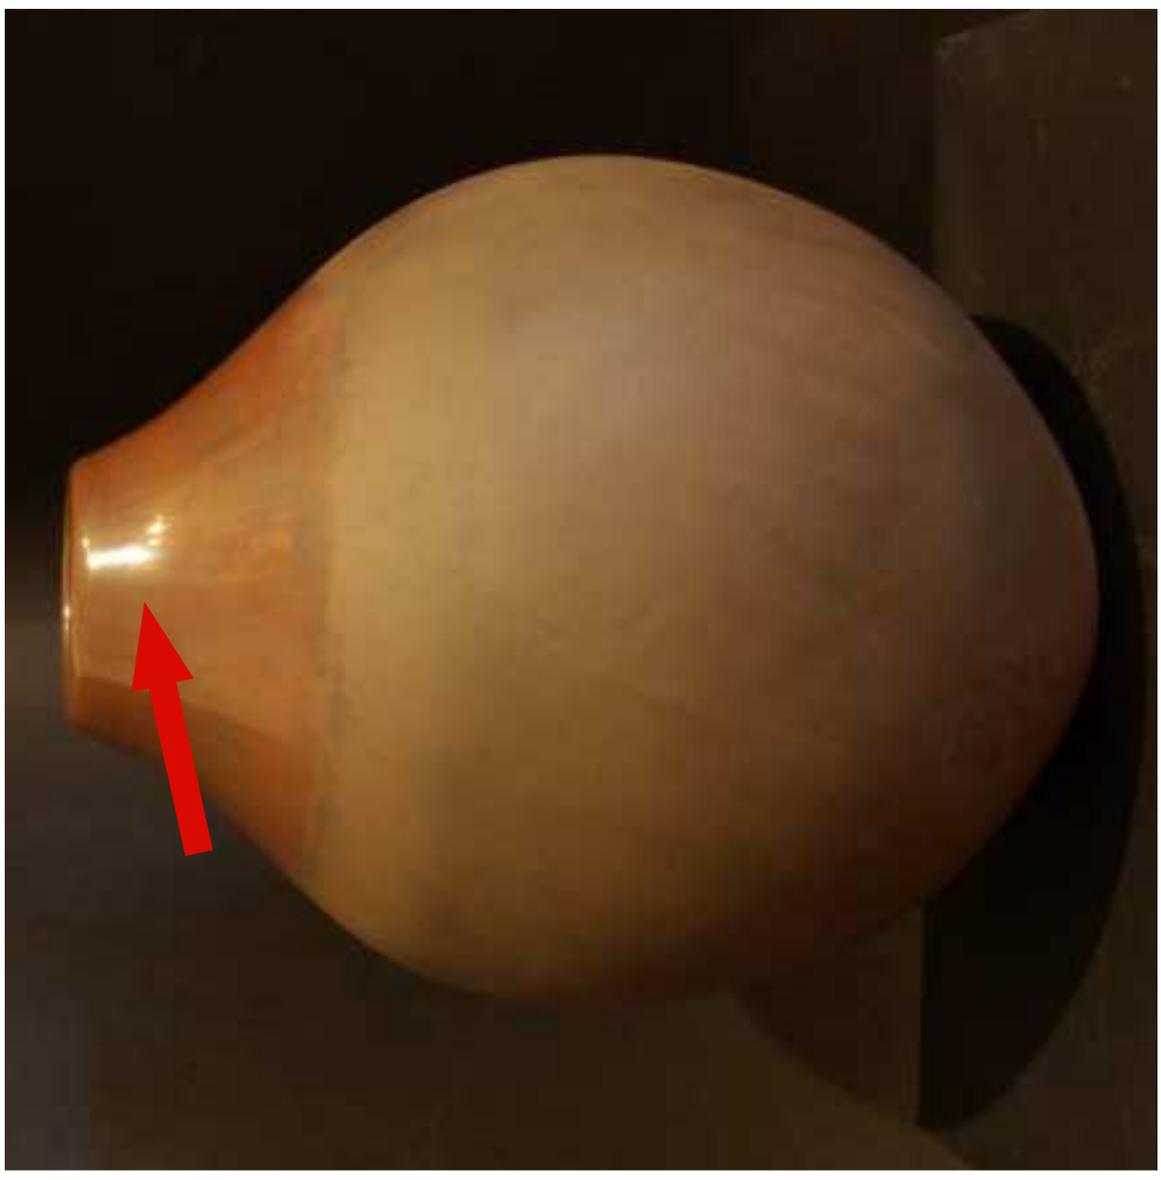

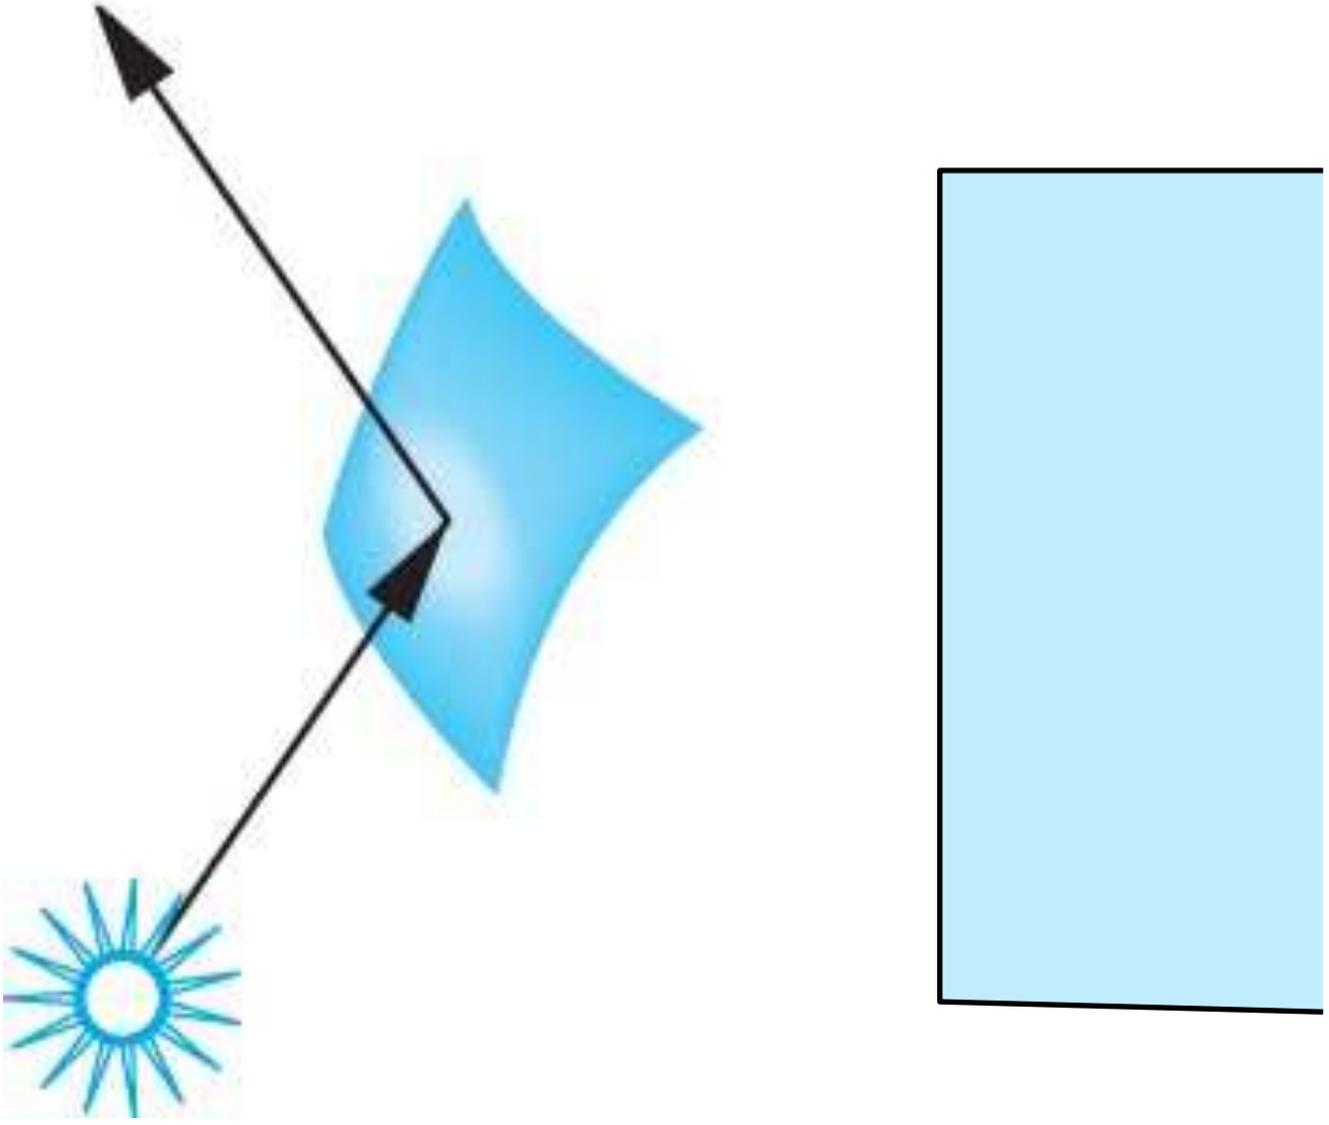

Ambient Reflection

$$I = L_a R_a + L_d R_d \max(0, \mathbf{n} \cdot \mathbf{l})$$

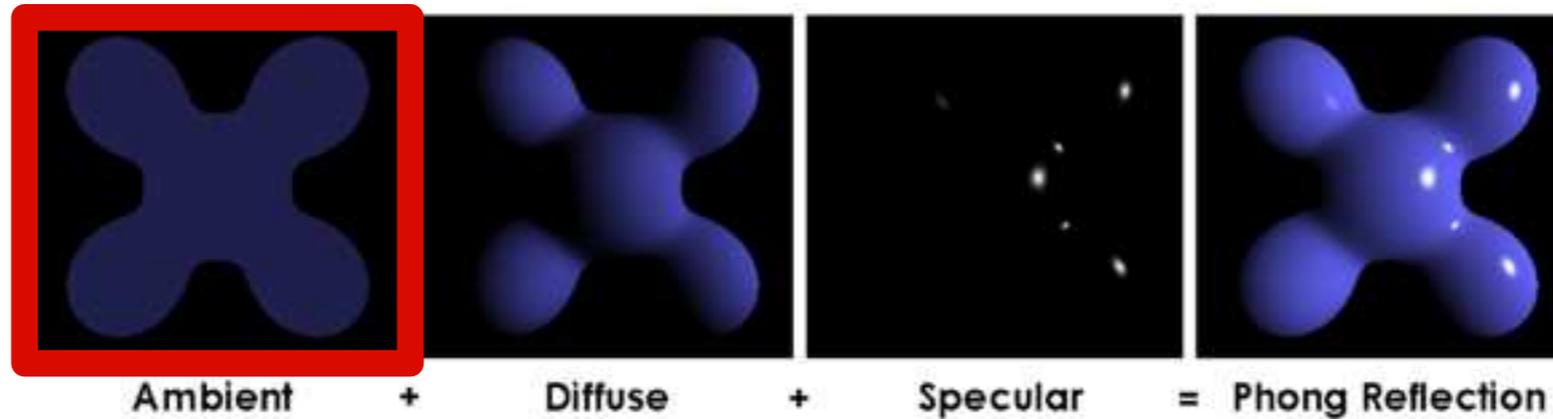

All surfaces get same amount of ambient light

Phong Reflection Model

Ambient reflection

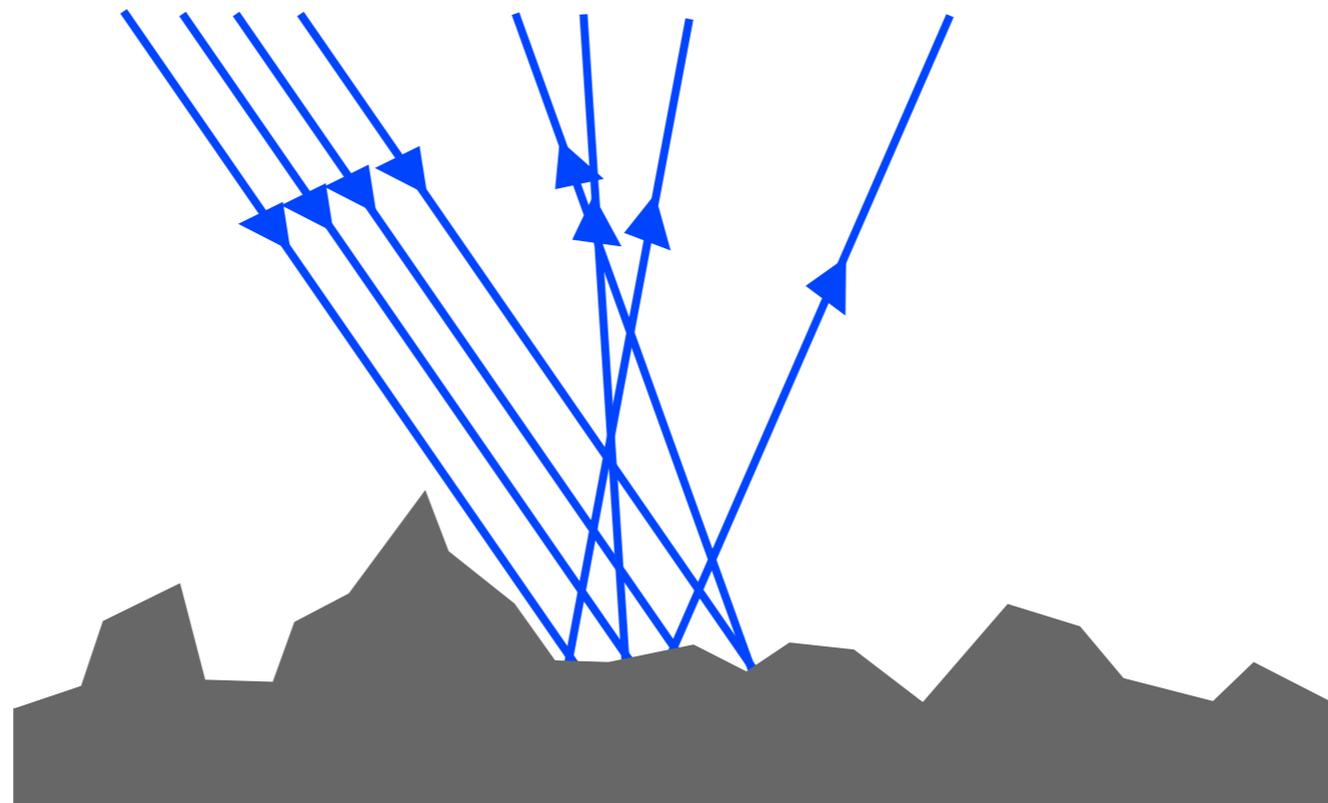

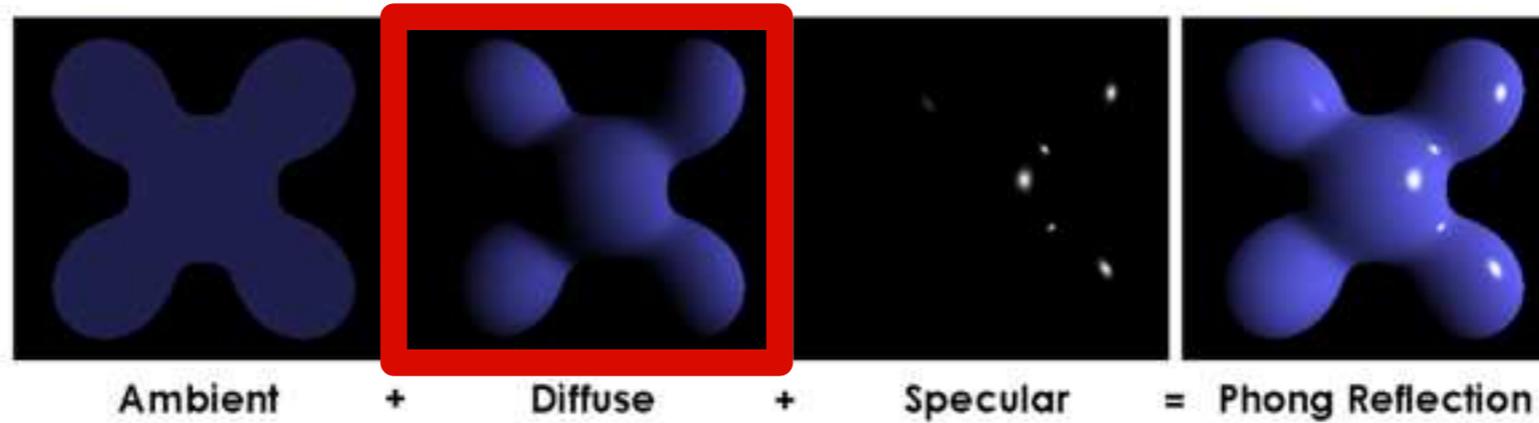

different ambient
coefficients for
different colors

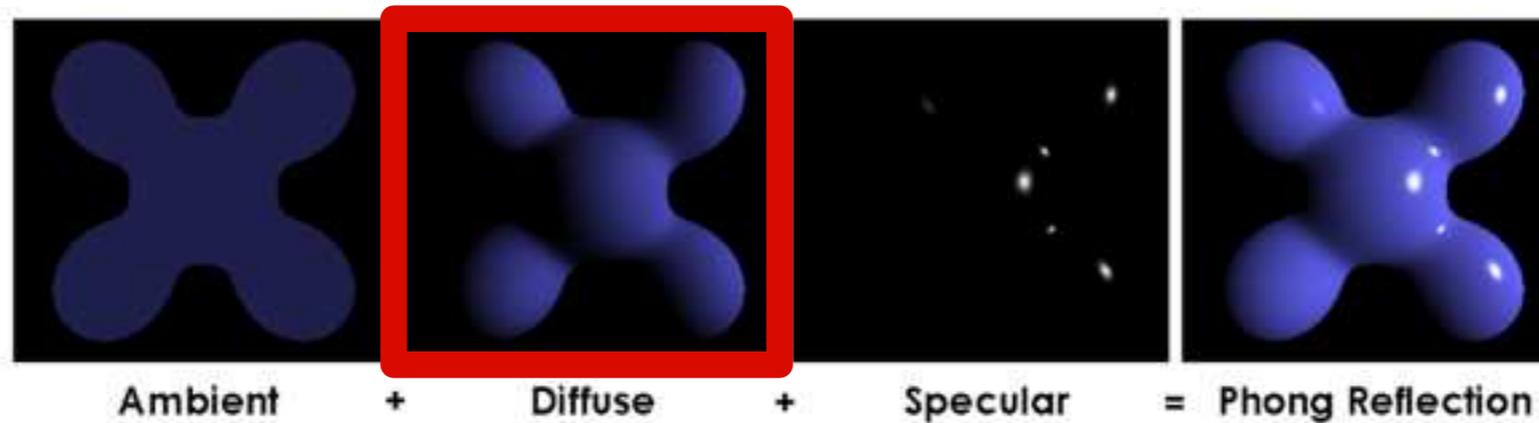

$$I_a = R_a L_a, \quad 0 \leq R_a \leq 1$$

*ambient
reflection
coefficient*

Diffuse reflection

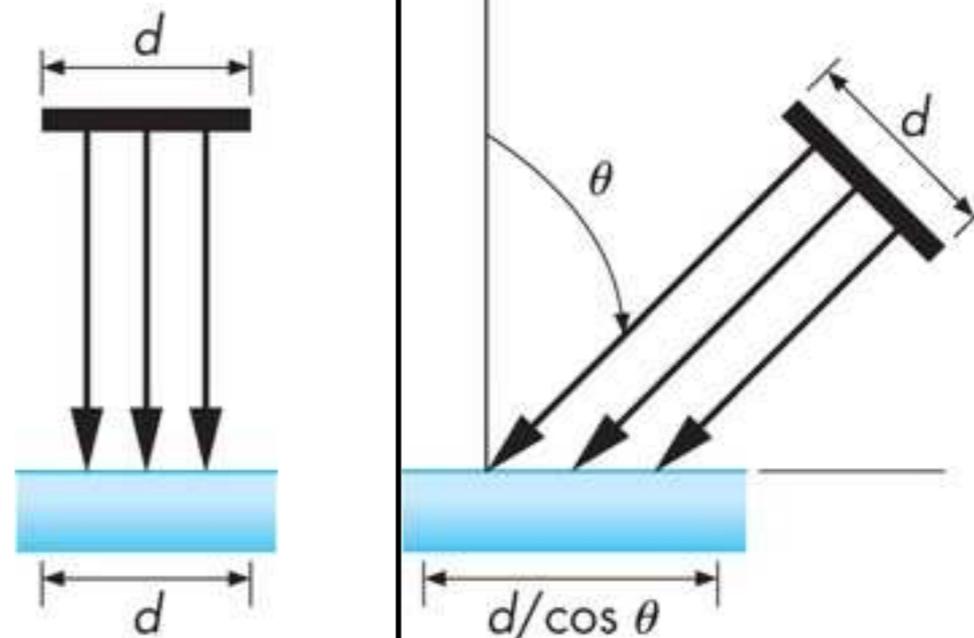

Diffuse reflection

$$I_d = R_d L_d \max(0, \mathbf{l} \cdot \mathbf{n})$$

diffuse reflection coefficient

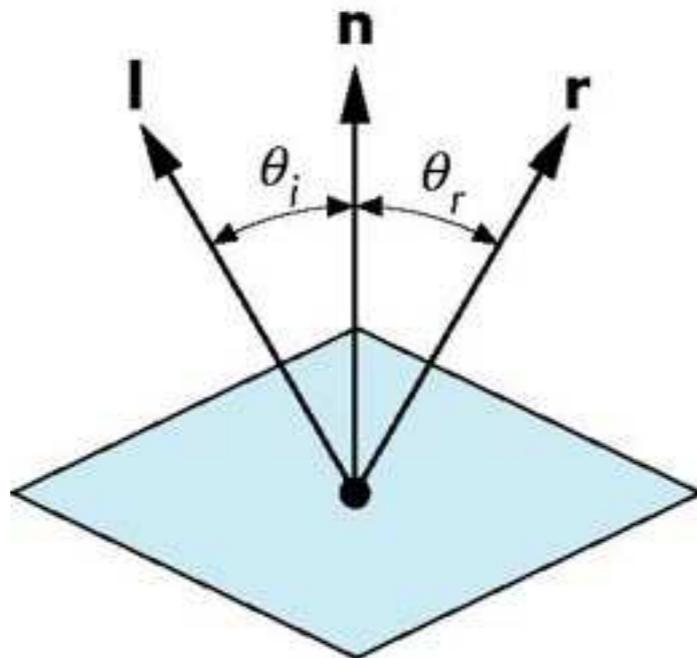

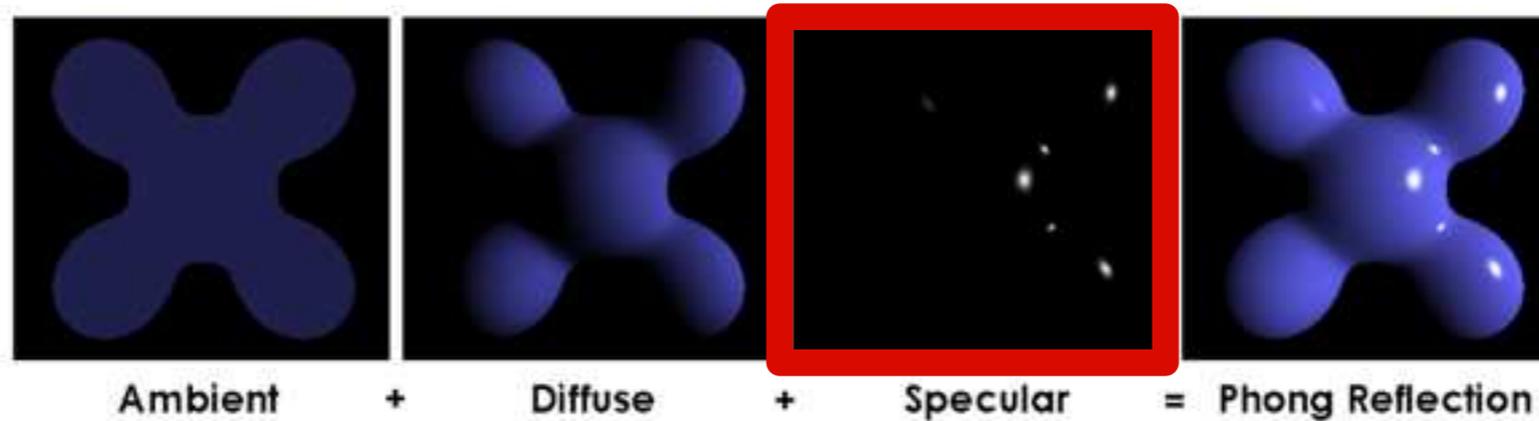

Lambert's cosine law

direct: maximum light intensity

indirect: reduced light intensity

Specular reflection

Ideal reflector

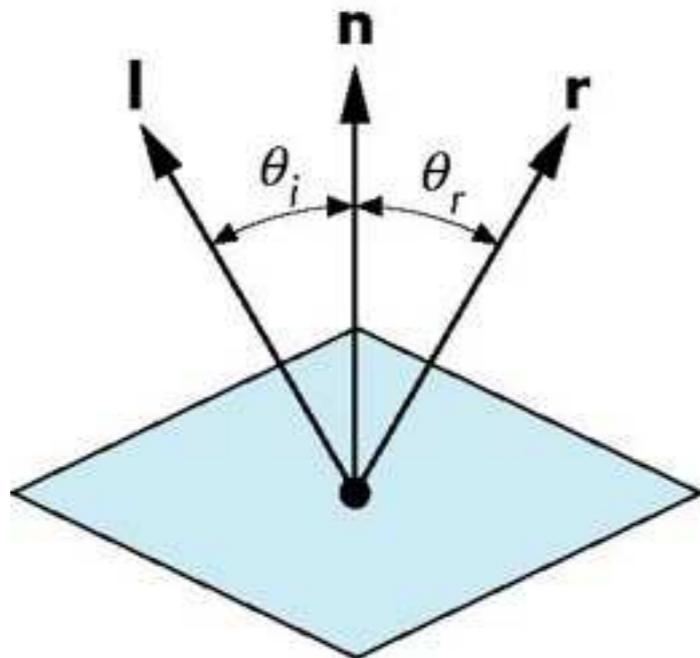

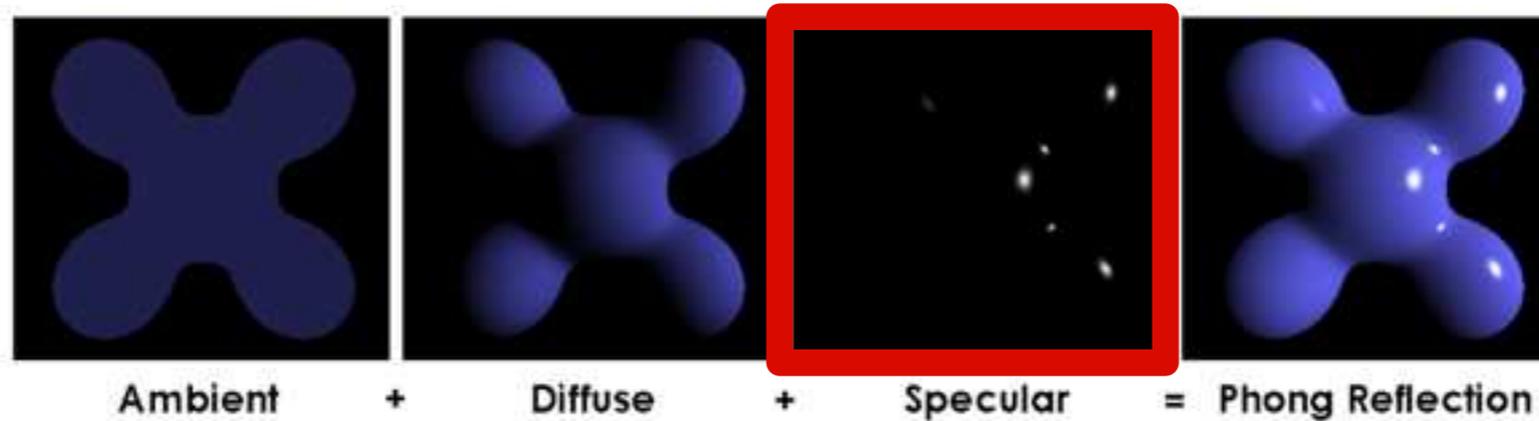

$$\theta_i = \theta_r$$

angle of
incidence

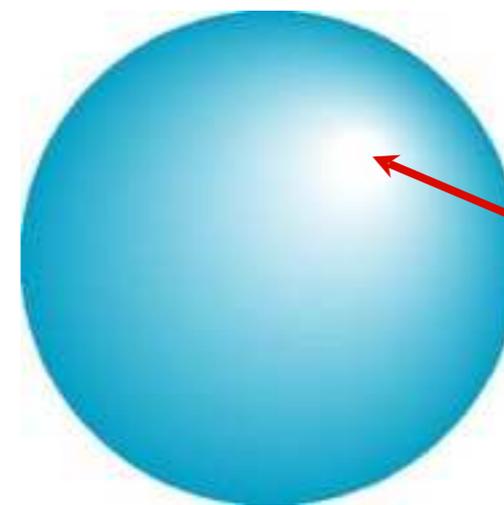

angle of
reflection

\mathbf{r} is the mirror reflection direction

Specular reflection

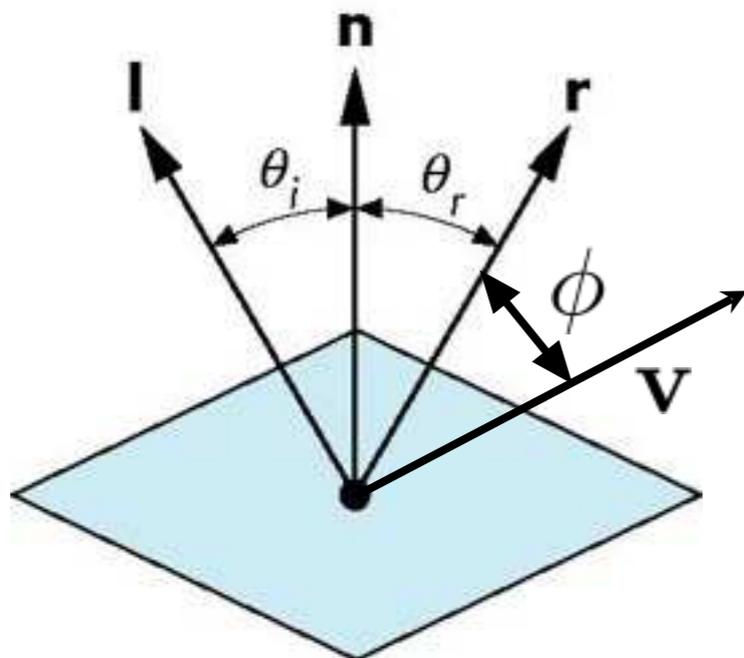

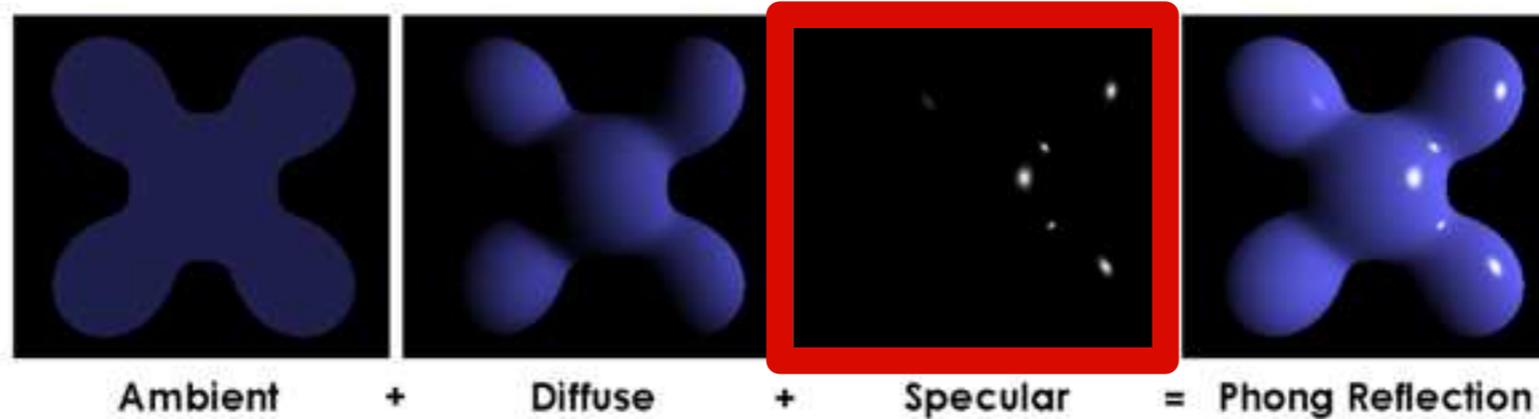

Specular surface

specular highlight

specular reflection is strongest in
mirror reflection direction

Specular reflection

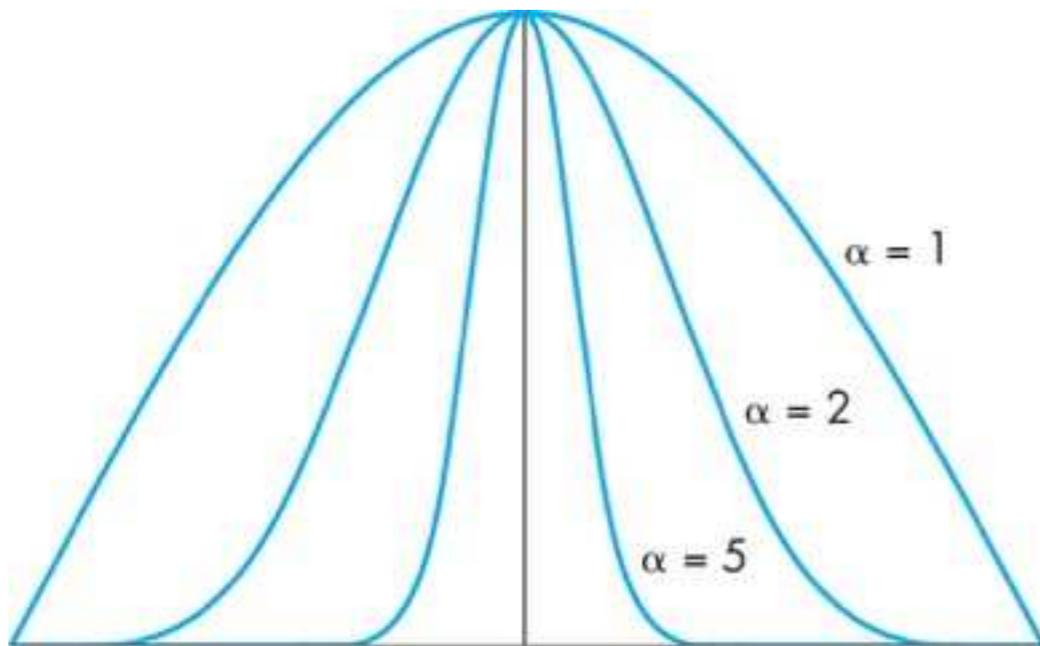

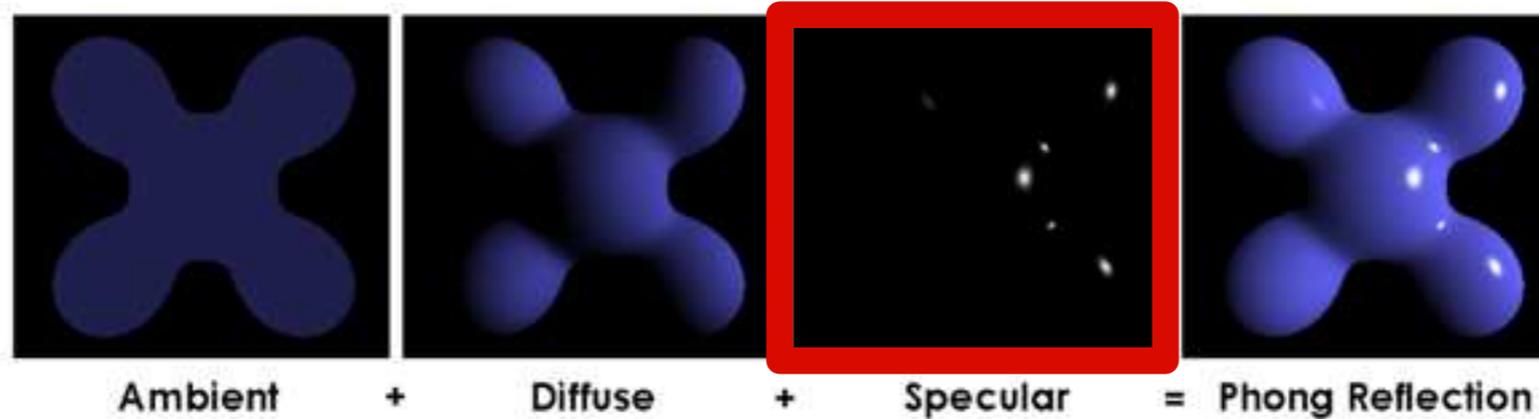

$$I_s = R_s L_s \cos^\alpha \phi$$

specular
reflection
coefficient

Phong
exponent

specular reflection drops off
with increasing angle ϕ

Specular reflection

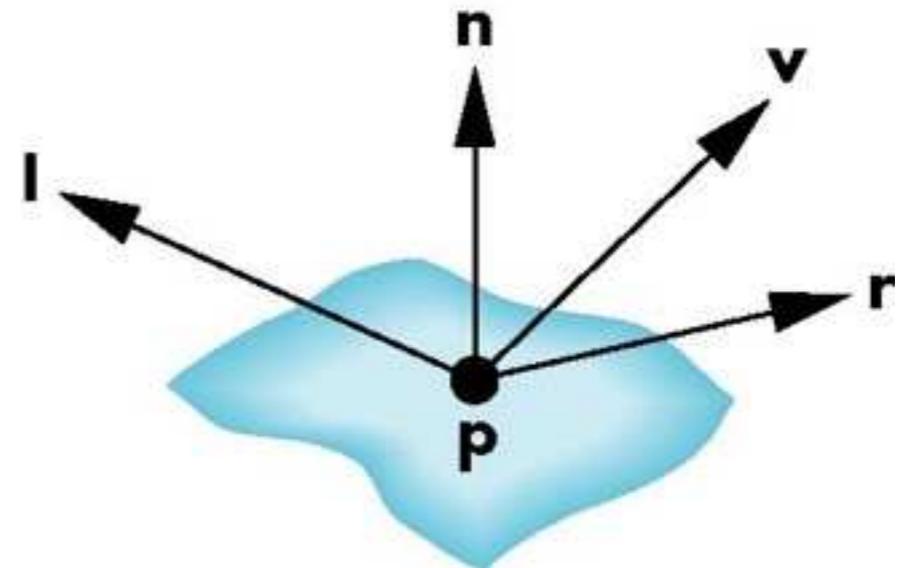

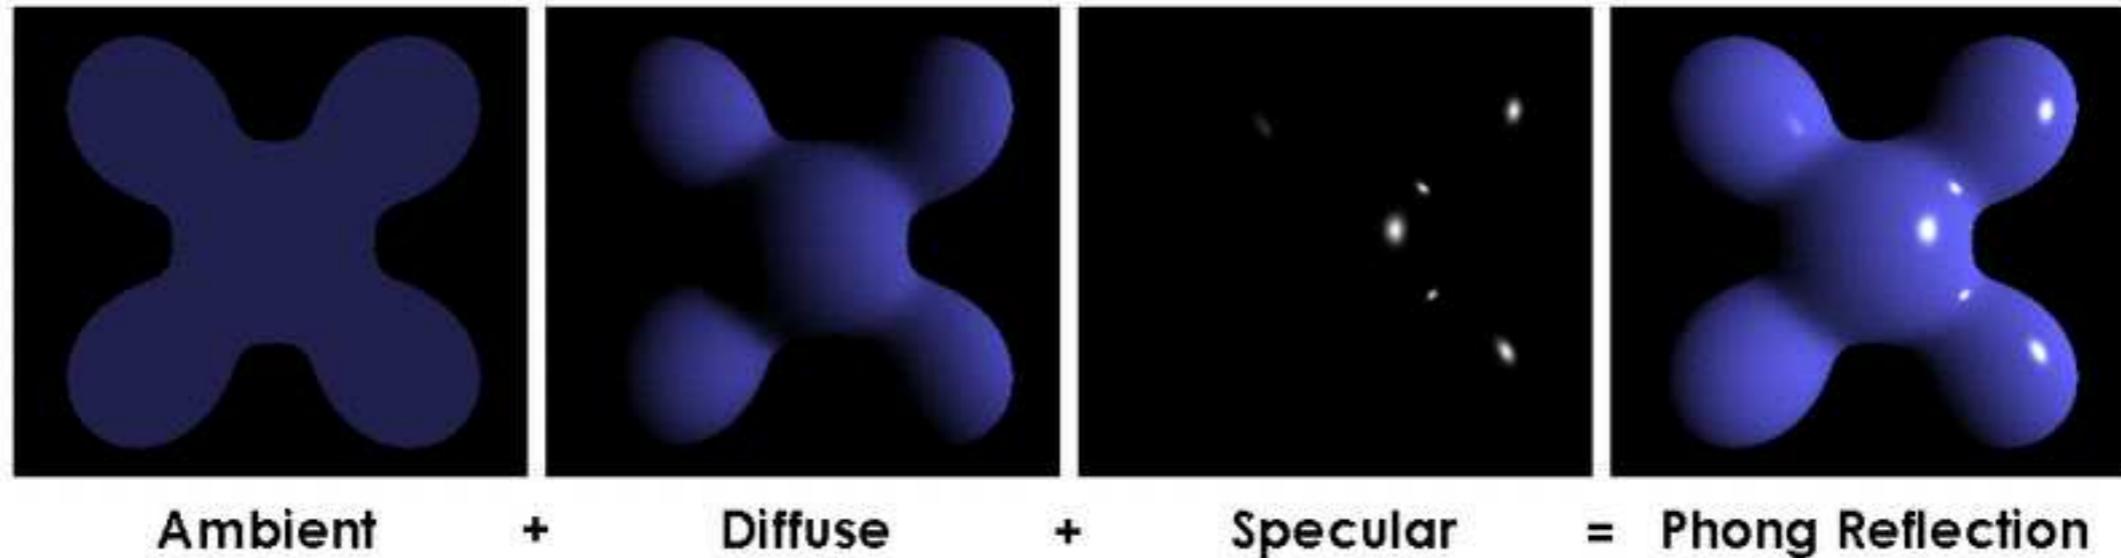

$$I_s = R_s L_s \max(0, \cos \phi)^\alpha$$

$\alpha = 5..10$ plastic
 $\alpha = 100..200$ metal

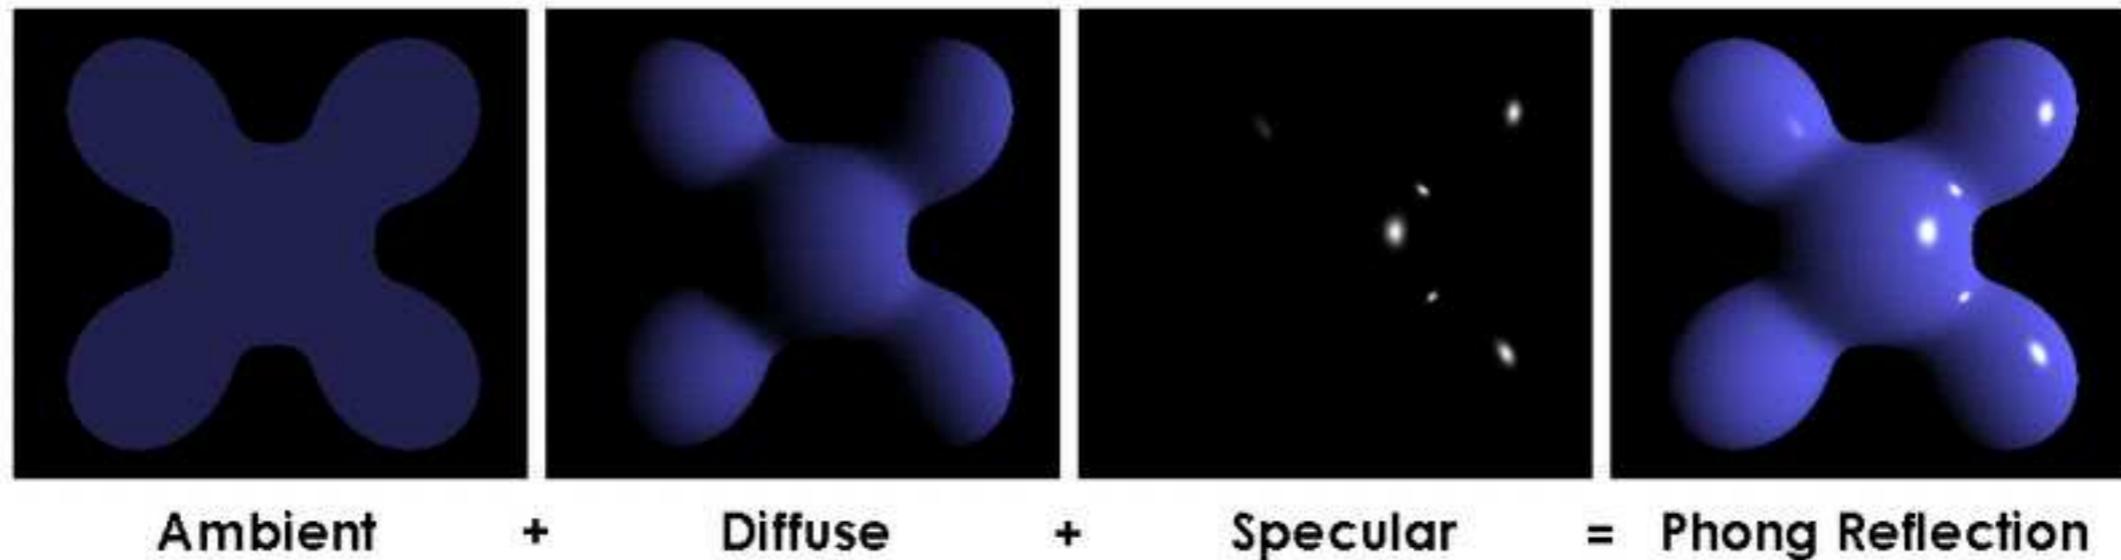

Phong
exponent

Phong Reflection Model

$$I = I_a + I_d + I_s$$
$$= \underbrace{R_a L_a}_{\text{Ambient}} + \underbrace{R_d L_d \max(0, \mathbf{l} \cdot \mathbf{n})}_{\text{Diffuse}} + \underbrace{R_s L_s \max(0, \mathbf{v} \cdot \mathbf{r})^\alpha}_{\text{Specular}}$$

Phong Reflection Model

[Brad Smith, Wikimedia Commons]

$$I = I_a + I_d + I_s$$
$$= R_a L_a + R_d L_d \max(0, \mathbf{l} \cdot \mathbf{n}) + R_s L_s \max(0, \cos \phi)^\alpha$$

color intensity

reflectance
