

# Lighting and Shading

University of California Riverside

# Why we need shading

- Suppose we build a model of a red sphere
- We get something like

- But we want

# Shading

- Why does a real sphere look like this?

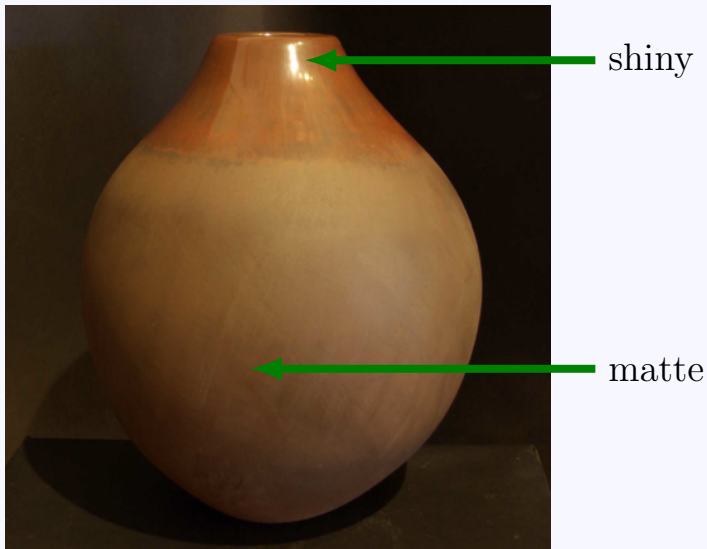

# Shading - lighting

- Why does a real sphere look like this?

# Shading - material properties

# Shading - viewing location

What if I move?

# Shading - surface orientation

# General rendering

- Based on physics
  - conservation of energy
- Surfaces can
  - absorb light
  - emit light
  - reflect light
  - transmit light

# Idealized light sources

ambient

point light

spotlight

directional light

# Ambient light

- Achieve uniform light level
- No shadows
- Same light level everywhere

# Point light

- Light emitted from a point  $\mathbf{p}$
- Uniform in all directions
- Falls off with distance:  $\ell(\mathbf{x}) = \frac{1}{\|\mathbf{x} - \mathbf{p}\|^2} L$

# Point light - limitations

# Soft shadows

# Spotlight

- Light emitted from a point  $\mathbf{p}$
- Emitted in a cone
- Brightest in middle of cone
- Falls off with distance

# Spotlight

$$l(\mathbf{x}) = \frac{\cos^e \phi}{\|\mathbf{x} - \mathbf{p}\|^2} L$$

# Spotlight - exploring $e$

# Directional light

- Light source at infinity
- Rays come in parallel
- No falloff
- Characterized by direction

# Lambertian reflection model

# Lambertian reflection model

	Light	Incident
Intensity	$L$	$L'$
Energy	$E = Lwa$	$E = L'wh$

# Lambertian reflection model

	Light	Incident	Reflected
Intensity	$L$	$L'$	$I = RL'$
Energy	$E = Lwa$	$E = L'wh$	$RE$

# Lambertian reflection model

	Light	Incident	Reflected
Intensity	$L$	$L'$	$I = RL'$
Energy	$E = Lwa$	$E = L'wh$	$RE$

$$I = LR \frac{a}{h}$$

# Lambertian reflection model

$$I = LR \frac{a}{h}$$

# Lambertian reflection model

$$I = LR \frac{a}{h} = LR \cos \theta$$

# Lambertian reflection model

$$I = LR \frac{a}{h} = LR \cos \theta = LR \mathbf{n} \cdot \mathbf{l}$$

# Lambertian reflection model

$$I = LR \frac{a}{h} = LR \cos \theta = LR \mathbf{n} \cdot \mathbf{l}$$

Avoid bug:  $I = LR \max(\mathbf{n} \cdot \mathbf{l}, 0)$

# Ambient reflection

$$I = LR \max(\mathbf{n} \cdot \mathbf{l}, 0)$$

Surfaces facing away from the light will be totally **black**

# Ambient reflection

$$I = L_a R_a + L_d R_d \max(\mathbf{n} \cdot \mathbf{l}, 0)$$

All surfaces get the same amount of ambient light

# Phong reflection model

# Phong reflection model

Ambient

+

Diffuse

+

Specular

=

Phong Reflection

- Efficient
- Reasonably realistic
- 3 components
- 4 vectors

# Phong reflection model

$$\begin{aligned} I &= I_a + I_d + I_s \\ &= R_a L_a + R_d L_d \max(\mathbf{n} \cdot \mathbf{l}, 0) + R_s L_s \max(\cos \phi, 0)^\alpha \end{aligned}$$

# Ambient reflection

$$I_a = R_a L_a$$

$$0 \leq R_a \leq 1$$

# Diffuse reflection

# Diffuse reflection

$$I_d = R_d L_d \max(\mathbf{n} \cdot \mathbf{l}, 0)$$

# Specular reflection

Ideal reflector

$$\theta_i = \theta_r$$

$\mathbf{r}$  is the mirror reflection direction

# Specular reflection

Specular surface

specular reflection is strongest in reflection direction

# Specular reflection

$$I_s = R_s L_s \max(\cos \phi, 0)^\alpha$$

specular reflection drops off with increasing  $\phi$

# Phong reflection model

$$I = I_a + I_d + I_s$$
$$= R_a L_a + R_d L_d \max(\mathbf{n} \cdot \mathbf{l}, 0) + R_s L_s \max(\mathbf{v} \cdot \mathbf{r}, 0)^\alpha$$
