

Tech report: augmented MPM for phase-change and varied materials

For our constitutive model we use $\hat{\Psi}_\mu(\mathbf{F}) = \Psi_\mu(J^{-\frac{1}{d}}\mathbf{F})$, where plasticity does not matter and is ignored for the purposes of computing these derivatives. For convenience, let $a = -\frac{1}{d}$, and μ subscripts are ignored. Then, $\hat{\Psi}(\mathbf{F}) = \Psi(J^a\mathbf{F})$. We begin by computing $\hat{\Psi}_\mu(\mathbf{F})$. We will use index notation for precision during the derivations. Differentiation by the matrix \mathbf{F}_{ij} is indicated by enclosing the index pair in parenthesis after a comma, as in $J_{(ij)}$. Let $\mathbf{H} = \mathbf{F}^{-T}$. We begin with some preliminary derivatives for J and \mathbf{H} .

$$\begin{aligned}
H_{ji}F_{jk} &= \delta_{ik} \\
J_{(ij)} &= JH_{ij} \\
(J^a)_{(ij)} &= aJ^{a-1}J_{(ij)} \\
&= aJ^{a-1}JH_{ij} \\
&= aJ^aH_{ij} \\
(H_{ji}F_{jk})_{(rs)} &= 0 \\
H_{ji,(rs)}F_{jk} + H_{ji}F_{jk,(rs)} &= 0 \\
H_{ji,(rs)}F_{jk} &= -H_{ji}F_{jk,(rs)} \\
H_{ji,(rs)}\delta_{jm} &= -H_{ji}\delta_{jr}\delta_{ks}H_{mk} \\
H_{ji,(rs)} &= -H_{ri}H_{js}
\end{aligned}$$

The derivatives of the quantity $J^a\mathbf{F}$ will occur frequently, so we begin by naming them and evaluating them.

$$\begin{aligned}
\mathcal{B}_{kmij} &= (J^a F_{km})_{(ij)} \\
&= J^a F_{km,(ij)} + (J^a)_{(ij)} F_{km} \\
&= J^a \delta_{ik} \delta_{jm} + a J^a F_{km} H_{ij} \\
\mathcal{B}_{kmij} Z_{ij} &= J^a \delta_{ik} \delta_{jm} Z_{ij} + a J^a F_{km} H_{ij} Z_{ij} \\
\mathcal{B}_{kmij} Z_{ij} &= J^a Z_{km} + a J^a F_{km} H_{ij} Z_{ij} \\
\mathbf{Z} : \mathcal{B} &= J^a (\mathbf{Z} + a(\mathbf{H} : \mathbf{Z})\mathbf{F}) \\
Z_{km} \mathcal{B}_{kmij} &= J^a \delta_{ik} \delta_{jm} Z_{km} + a J^a F_{km} H_{ij} Z_{km} \\
Z_{km} \mathcal{B}_{kmij} &= J^a Z_{ij} + a J^a F_{km} Z_{km} H_{ij} \\
\mathbf{Z} : \mathcal{B} &= J^a (\mathbf{Z} + a(\mathbf{F} : \mathbf{Z})\mathbf{H}) \\
\mathcal{B}_{kmij,(rs)} &= (J^a (\delta_{ik} \delta_{jm} + a F_{km} H_{ij}))_{(rs)} \\
\mathcal{B}_{kmij,(rs)} &= (J^a)_{(rs)} (\delta_{ik} \delta_{jm} + a F_{km} H_{ij}) + J^a (\delta_{ik} \delta_{jm} + a F_{km} H_{ij})_{(rs)} \\
\mathcal{B}_{kmij,(rs)} &= a J^a H_{rs} (\delta_{ik} \delta_{jm} + a F_{km} H_{ij}) + a J^a (F_{km,(rs)} H_{ij} + F_{km} H_{ij,(rs)}) \\
\mathcal{B}_{kmij,(rs)} &= a \mathcal{B}_{kmij} H_{rs} + a J^a (\delta_{kr} \delta_{ms} H_{ij} - F_{km} H_{rj} H_{is})
\end{aligned}$$

With the operator \mathcal{B} , we can express the relationship between $\hat{\mathbf{A}} = \frac{\partial \hat{\Psi}}{\partial \mathbf{F}}(\mathbf{F})$ and $\mathbf{A} = \frac{\partial \Psi}{\partial \mathbf{F}}(J^a \mathbf{F})$.

$$\begin{aligned}\hat{\Psi}(F_{ij}) &= \Psi(J^a F_{ij}) \\ \hat{\Psi}_{,(ij)} &= \Psi_{,(km)}(J^a F_{km})_{,(ij)} \\ &= \Psi_{,(km)} \mathcal{B}_{kmij} \\ \hat{\mathbf{A}} &= \mathbf{A} : \mathcal{B}\end{aligned}$$

Finally, we relate $\mathcal{C} = \frac{\partial^2 \Psi}{\partial \mathbf{F} \partial \mathbf{F}}(J^a \mathbf{F})$ to $\hat{\mathcal{C}} = \frac{\partial^2 \hat{\Psi}}{\partial \mathbf{F} \partial \mathbf{F}}(\mathbf{F})$.

$$\begin{aligned}\hat{\Psi}_{,(ij)(rs)} &= (\Psi_{,(km)} \mathcal{B}_{kmij})_{,(rs)} \\ \hat{\Psi}_{,(ij)(rs)} &= \Psi_{,(km)(tu)} \mathcal{B}_{turs} \mathcal{B}_{kmij} + \Psi_{,(km)} \mathcal{B}_{kmij} \mathcal{B}_{(rs)} \\ \hat{\Psi}_{,(ij)(rs)} &= \Psi_{,(km)(tu)} \mathcal{B}_{turs} \mathcal{B}_{kmij} + a\Psi_{,(km)} \mathcal{B}_{kmij} H_{rs} + aJ^a \Psi_{,(rs)} H_{ij} - aJ^a \Psi_{,(km)} F_{km} H_{rj} H_{is} \\ \hat{\Psi}_{,(ij)(rs)} Z_{rs} &= \Psi_{,(km)(tu)} \mathcal{B}_{turs} \mathcal{B}_{kmij} Z_{rs} + a\Psi_{,(km)} \mathcal{B}_{kmij} H_{rs} Z_{rs} + aJ^a \Psi_{,(rs)} H_{ij} Z_{rs} - aJ^a \Psi_{,(km)} F_{km} H_{rj} H_{is} Z_{rs} \\ \hat{\mathcal{C}} : \mathbf{Z} &= (\mathcal{C} : (\mathcal{B} : \mathbf{Z})) : \mathcal{B} + a(\mathbf{H} : \mathbf{Z}) \mathbf{A} : \mathcal{B} + aJ^a (\mathbf{A} : \mathbf{Z}) \mathbf{H} - aJ^a (\mathbf{A} : \mathbf{F}) \mathbf{H} \mathbf{Z}^T \mathbf{H}\end{aligned}$$
