

CS 150: The Theory of Automata and Formal Languages

Fall, 2026

Course description: The course introduces some fundamental concepts in automata theory and formal languages including grammar, finite automaton, regular expression, formal language, pushdown automaton, and Turing machine. Not only do they form basic models of computation, they are also the foundation of many branches of computer science, *e.g.* compilers, software engineering, concurrent systems, etc. The properties of these models will be studied and various rigorous techniques for analyzing and comparing them will be discussed, by using both formalism and examples.

Course format: The course consists of two 80-minute lectures in Watkins 1101 on MW at 6:30-7:50pm and one 50-minute discussion session per week. The lectures are only offered in-person this quarter, but recordings of similar lectures from the past can be made available on Canvas/Yuja upon request. The discussion sessions start in the first full week of the quarter (*i.e.*, the week of Sept. 28). Each discussion session will be led by a TA and used primarily to enforce concepts and techniques learned in class.

Prerequisite: CS 10C and CS/MATH 111. The students are expected to have a strong background in the fundamentals of discrete mathematics (symbolic logic, set, induction, number theory, summation, series, combinatorics, graph, recursion, basic proof techniques, etc.), algorithms and data structures. Some knowledge of programming languages, programming, and computer architecture will be helpful.

Instructor: Tao Jiang, WCH 336, email: jiang@cs.ucr.edu. Office Hours: MW 4:00-5:00pm. Zoom sessions can be made available upon special requests and the meeting ID is 886 998 0294.

Teaching Assistants: The TA office hours are held on R 5:30-6:30pm and F 9:45-10:45am in WCH 136.

UCR Academic Resources Center (ARC): 156 Skye Hall. See www.arc.ucr.edu.

Textbook: J. Hopcroft, R. Motwani, and J. Ullman. *Introduction to Automata Theory, Languages, and Computation*, 3rd edition, 2007, Pearson/Addison-Wesley. Available for purchase/rent via the Internet (2nd edition okay too). It can be borrowed for short periods from <https://www.hathitrust.org> (with UCR NetID) and <https://archive.org/account/signup>. Relevant chapters are also available on eLearn/Canvas.

Lecture notes: Copies of slides used in lectures are available on the class homepage www.cs.ucr.edu/~jiang/150-homepage.html in the PDF format.

Reference books (on reserve at the Science Library):

- (1) P. Linz and S. Ridger. *Introduction to Formal Languages and Automata*, 7th edition, 2022 (earlier editions okay), Jones and Barlett.
- (2) C. Allison. *Foundations of Computing: An Accessible Introduction to Formal Languages*, 2021, Fresh Sources, Inc.
- (3) A. Maheshwari and M. Smid. *Introduction to Theory of Computation*, 2019, <https://cglab.ca/~michiel/TheoryOfComputation/TheoryOfComputation.pdf>

Grading:

- 5 homework assignments (all paper and pencil) — 25%
- Midterm I (40 minutes in class, Wed., Oct. 28) — 10%
- Midterm II (full class, Wed., Nov. 18) — 20%
- Final examination (Tue., Dec. 8, 7:00 - 9:50pm) — 45%

Reading assignment: You are expected to review, before and after each class, the material to be covered in the class. A reference to the chapters of the text and major reference books that will be covered in lectures can be found in the *tentative timetable* below.

Assignment policy:

1. All assignments will be posted on the class homepage www.cs.ucr.edu/~jiang/150-homepage.html, and submitted on Gradescope.
2. You have roughly one and half weeks for each homework assignment.
3. Make sure to always include your full name, ID, and the assignment number on the first page.
4. Write legibly. What cannot be read will not be graded.
5. No late assignments will be accepted.

Academic dishonesty: Many students find it helpful to consult their peers while doing assignments. This practice is legitimate and to be expected. However, it is not acceptable practice to pool thoughts and produce common answers. To avoid this situation, it is suggested that students not write anything down during such talks, but keep mental notes for later development of their own. Major occurrences of academic dishonesty, such as the submission of work that is not the student's own, will be dealt with according to UCR's policies on academic dishonesty that can be found at webpage

<http://conduct.ucr.edu/policies/academicintegrity.html>. Students who allow their answers to be copied are as guilty of academic dishonesty as those who copy and will be treated accordingly. Each student is responsible for taking reasonable precautions to ensure that his/her work is not available for unauthorized use.

Copying solutions from the Internet/AI models or books or any other sources without explicit citations and explanations is prohibited!

Table 1: Tentative Timetable

Week of	Topic	Chapters of		
		[HMU]	[Linz]	[MS]
Sept 28	basic concepts of finite automata and languages	1,2	1,2	1,2
	deterministic finite automaton, nondeterminism	2	2	2
Oct 5*	equivalence between DFAs, NFAs and ϵ -NFAs	2,3	2,3	2
	regular expression			
Oct 12*	equivalence between regular expression and FA	3	3	2
	algebraic laws for regular expressions	3	3	
Oct 19	pumping lemma and applications	4	4	2
	properties of regular languages	4	4	
Oct 26*	equivalence and minimization of DFAs	4	2	
	Midterm I on Oct 28			
Nov 2*	context-free grammars and languages	5	5	3
	parsing (or derivation) and parse trees	5	5	3
Nov 9	ambiguity of grammars and languages	5	5	
	pushdown automaton (PDA) and various forms	6	7	3
Nov 16*	equivalence between CFG and PDA	6	7	3
	Midterm II on Nov 18			
Nov 23	Chomsky normal form of CFG	7	6	3
	pumping lemma for CFLs and closure properties	7	8	3
Nov 30	more properties of CFLs	7	8	3
	Turing machines and (un)decidability	8	9,12	4
