Design for Hardware Trust

HINT Project Profile

- ▶ **HINT** = Holistic Approaches for Integrity of ICT-Systems
- ▶ **Project Number:** 317930
- ▶ **Project website:**
www.hint-project.eu
- ▶ **Project start:** October 1, 2012
- ▶ **Project duration:** 3 years
- ▶ **Total Costs:** €5.103.893
- ▶ **EC-Contribution:** €3.350.000
- ▶ Project is co-financed by the **European Commission** under **Seventh Framework Programme**

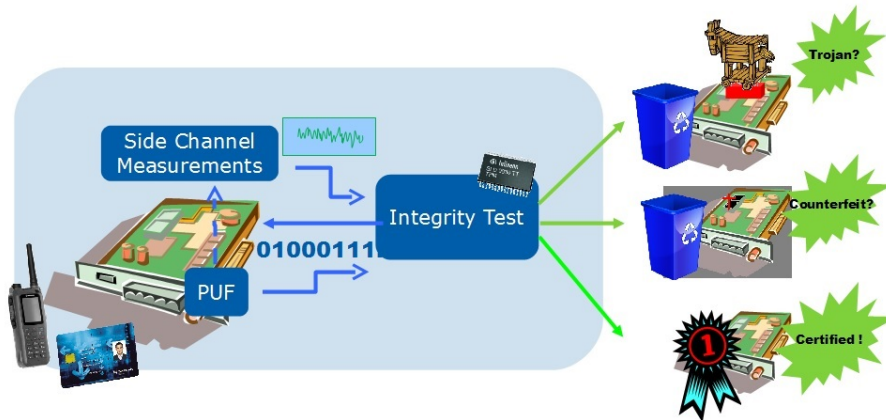

Motivation

- ▶ **Authenticity** and **integrity** of hardware components in modern ICT systems
- ▶ Security challenged by **improving attacks**
Recent trends:
 - ▶ **Counterfeiting** of hardware components
 - ▶ **"Hardware Trojans"**: Hidden functions in Integrated Circuits
- ▶ HINT proposal:
Novel technologies to support **assurance of genuineness and integrity**

Technical Approach

- ▶ Holistic Integrity Checking for Components in ICT-Systems

Objectives

- ▶ Main objective: **Improve security** of architectures and platforms based on tamper-resistant integrated circuits
- ▶ Development of methods to:
 - ▶ Perform **at-time-of-use integrated checking** of the global integrity of a system for hardware and embedded software
 - ▶ Check the **“genuineness”** of the secure integrated circuits by detecting functional clones or counterfeited circuits
 - ▶ Detect the presence of **Hardware Trojans**
- ▶ Main technologies used:
 - ▶ **Physically Unclonable Functions**, enabling to authenticate a hardware component using a physical, intrinsic and unique property of the device
 - ▶ **Side Channel based analysis** to monitor the behaviour of hardware components and to detect changes from their original specifications and implementations

Side-Channels: Challenges & Solutions

Some Subtleties

Summary

Design for Hardware Trust

Hardware Trojan (HT)

- ▶ **Malicious** modifications of an Integrated Circuit (IC) during its design flow

FAKE Counterfeiting has become a big problem for the U.S. military, and bogus packaging could disguise a questionable chip as a legitimate one. ...& **BAKE** Baking a chip for 24 hours after fabrication could shorten its life span from 15 years to a scant 6 months.

ADD EXTRA TRANSISTORS
Adding just 1000 extra transistors during either the design or the fabrication process could create a kill switch or a trapdoor. Extra transistors could enable access for a hidden code that shuts off all or part of the chip.

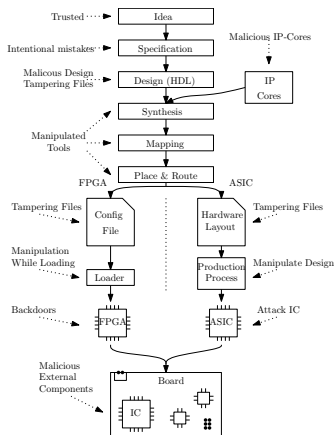

NICK THE WIRE
A notch in a few interconnects would be almost impossible to detect but would cause eventual mechanical failure as the wire became overloaded.

ADD OR RECONNECT WIRING
During the layout process, new circuit traces and wiring can be added to the circuit. A skilled engineer familiar with the chip's blueprints could reconnect the wires that connect transistors, adding gates and hooking them up using a process called circuit editing.

Context

- ▶ Outsourcing of the fabrication of the ICs
- ▶ Difficult to ensure the trust in all the steps of the design flow

Hardware Trojans in Practice

- ▶ **2005**: US Department of Defense
- ▶ **2007**: DARPA “Trust in IC Program”
- ▶ **2009**: “Hot Topic” of CHES conference
- ▶ **After 2009**: other conferences (DATE, HOST, CARDIS, ReConFig, etc.)
- ▶ [Skorobogatov *et al.*: “Breakthrough Silicon Scanning Discovers Backdoor in Military Chip”, CHES **2012**]
- ▶ [Becker *et al.*: “Stealthy Dopant-Level Hardware Trojans”, CHES **2013**]
- ▶ Research projects like **HINT** (European funded)
- ▶ ⇒ HTs: **real and emerging threat**

Possible Payloads

- ▶ Kill switch
 - ▶ Fighters
- ▶ Dysfunctional circuit
 - ▶ Satellite which works only 6 months
- ▶ Secret information leakage
 - ▶ Ciphred communications
- ▶ Help a malware by providing a backdoor
 - ▶ Privilege escalation, automatic login, password theft
- ▶ Prevent from going to sleep mode
 - ▶ Autonomy
- ▶ etc.

Hardware Trojan Taxonomy

HT Detection Methods

Overview

Logic Testing: Challenges & Solutions

Side-Channels: Challenges & Solutions

Some Subtleties

Summary

Design for Hardware Trust

Hardware Trojan Taxonomy

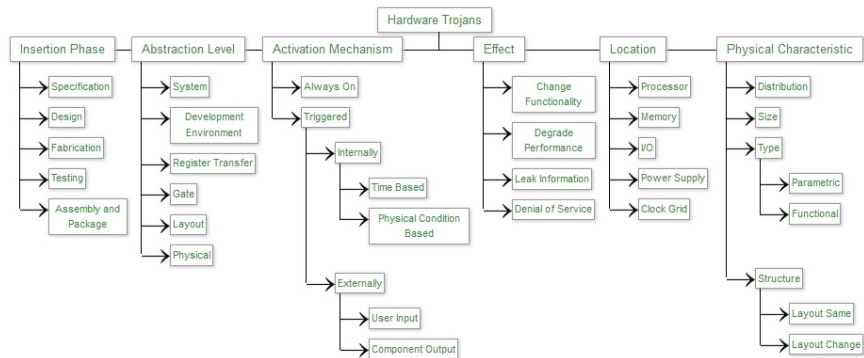

- ▶ **Taxonomy**: tree where each branch defines a different property
- ▶ In the ideal case, a specific HT must be on **only one leaf** of the tree

Benefits of the taxonomy

- ▶ **Systematic study** of their characteristics
- ▶ **Specific detection methods** for each HT class
- ▶ **Benchmark circuits** for each class

- ▶ Best existing taxonomy: **Trust-Hub**

Trust-Hub Taxonomy

Factoring the Taxonomy

- ▶ 4 (effects) \times 5 (locations) \times 5 (insertion phases) \times 6 (abstraction levels) \times 5 (activation mechanisms) = **3000 different HTs!**
- ▶ **Very rich taxonomy!**
- ▶ Impossible to implement them **all**, and then detect them
- ▶ \Rightarrow **Factoring this taxonomy**
- ▶ Total: \sim **100 HTs**

Logic Testing: Challenges & Solutions

Side-Channels: Challenges & Solutions

Some Subtleties

Summary

Design for Hardware Trust

HT Detection Methods Overview

- ▶ No method is 100% successful!

Detect HTs? Not so easy...

1. **Systems on Chip** are more and more **complex**, and detecting a small malicious modification is difficult
2. Reverse-engineering inspection is costly and difficult
 - ▶ **No guarantee** that the remaining ICs are HT-free
3. By nature, HTs are designed to be **stealthy**
 - ▶ Not easily **detectable** with conventional logic testing
4. By nature, HTs are **small** to be not easily detected by optical analysis
 - ▶ Difficult to detect them with **side-channel** (power consumption, electromagnetic radiations, etc.) analysis

The HINT Project

Introduction to Hardware Trojans

Hardware Trojan Taxonomy

HT Detection Methods

Overview

Logic Testing: Challenges & Solutions

Side-Channels: Challenges & Solutions

Some Subtleties

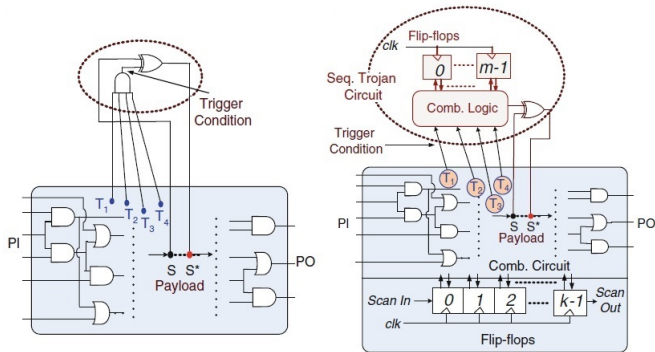

Summary

Design for Hardware Trust

Test Generation (1/2)

- ▶ Conventional logic testing cannot be used to reliably detect HT
- ▶ Manufacturing defects (stuck-at-faults) \neq HT effects
- ▶ Difficult to trigger a HT
 - ▶ *Time-bombs*
- ▶ Some HTs have no impact on functional outputs (*Trojan Side-Channels*)
- ▶ Vast spectrum of possible HTs

Test Generation (2/2)

- ▶ HTs are on **low controllability and observability** nodes for a rare triggering
- ▶ Extremely challenging to exhaustively generate test vectors for triggering a HT

Deterministic vs. Probabilistic Approach

- ▶ **Deterministic approach** difficult
 - ▶ Many possible HTs
 - ▶ Function of some IC nodes
 - ▶ ⇒ **Exhaustive enumeration impossible**
- ▶ **Statistic approach** :
 1. Find rare events in the circuit
 2. Get a list of HTs which can be inserted
 3. Generate test vectors and estimate their coverage
 4. ⇒ Set of **high quality test vectors**
- ▶ **85%** reduction in testset length compared to a random approach, but less efficient with big triggers and takes a long time

The HINT Project

Introduction to Hardware Trojans

Hardware Trojan Taxonomy

HT Detection Methods

Overview

Logic Testing: Challenges & Solutions

Side-Channels: Challenges & Solutions

Some Subtleties

Summary

Design for Hardware Trust

Side-Channel Analysis

- ▶ Any HT in the IC should modify its leakage current (IDDQ), dynamic power trace (IDDT), path-delay characteristic, ElectroMagnetic (EM) radiation.
- ▶ **Don't need to trigger** a HT for measuring its effects
- ▶ **Test vectors generation easier** than for logic testing
- ▶ Needs **HT-free circuits**
 - ▶ Get side-channel measurements and then *reverse-engineering* to check if the IC is HT-free
- ▶ If so, the measurements become a reference, and we can then **compare** the side-channels of the other circuits

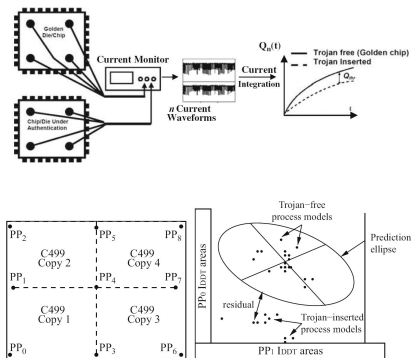

Global Side-Channel Analysis

- ▶ Green: RSA signal
- ▶ Red: Process noise (offset)
- ▶ Black: HT signal (offset)

Local Side-Channel Analysis

- ▶ **Local Side-Channel Analysis** more efficient than global ones
- ▶ Needs again **HT-free circuits**

- ▶ **Maximize/Minimize the activity** of some IC areas

Noise and Sensitivity

Sensitivity vs. Trojan Size

The HINT Project

Introduction to Hardware Trojans

Hardware Trojan Taxonomy

HT Detection Methods

Overview

Logic Testing: Challenges & Solutions

Side-Channels: Challenges & Solutions

Some Subtleties

Summary

Design for Hardware Trust

Some Subtleties

- ▶ **Added circuitry** for the HT detection must not be **infected** itself
 - ▶ At best, the added circuitry is **disabled** (e.g., fault countermeasure)
 - ▶ At worst, it can be turned into a **backdoor** (e.g., scan chain)
- ▶ A HT triggering logic can exploit the “**Test/Scan Enable**” control line to disable itself
- ▶ **Parametric HTs** very difficult to detect

The HINT Project

Introduction to Hardware Trojans

Hardware Trojan Taxonomy

HT Detection Methods

Overview

Logic Testing: Challenges & Solutions

Side-Channels: Challenges & Solutions

Some Subtleties

Summary

Design for Hardware Trust

Summary

	Logic testing approach	Side-channel approach
Pros	(a) Effective for small Trojans (b) Robust under process noise	(a) Effective for large Trojans (b) Test generation is easy
Cons	(a) Test generation is complex (b) Large Trojan detection challenging	(a) Vulnerable to process noise (b) Small Trojan detection challenging

- ▶ **Complementary** methods
- ▶ **Combine** test-time and run-time methods
- ▶ Modify the IC for **assistive** and **preventive** methods
 - ▶ ⇒ **Design for Hardware Trust**

The HINT Project

Introduction to Hardware Trojans

Hardware Trojan Taxonomy

HT Detection Methods

- Overview

- Logic Testing: Challenges & Solutions

- Side-Channels: Challenges & Solutions

- Some Subtleties

- Summary

Design for Hardware Trust

Introduction

- ▶ To improve HT detection rate, modify the IC
- ▶ ⇒ **Design for Hardware Trust**
 - ▶ Prevent from the insertion of HT
 - ▶ Ease side-channel analysis and logic testing
- ▶ 4 main methods:
 - ▶ Delay-Based Methods
 - ▶ Rare Event Removal
 - ▶ Design for Trojan Test
 - ▶ Proof-Carrying Hardware
- ▶ Run-Time Detection Methods

Run-Time Methods

- ▶ Last line of defense
- ▶ On-line monitoring of the IC in real-time, for checks:
 - ▶ Critical operations,
 - ▶ Idle mode,
 - ▶ Security policies,
 - ▶ Performance or availability of some units,
 - ▶ etc.
- ▶ Costly

Run-Time Methods

- ▶ Disable one suspect block or force one operation
- ▶ SPN : *Signal Probe Network*
- ▶ SM : *Security Monitor* (~ FSM)
- ▶ SECOPRO : *Security and Control Processor*
- ▶ Configurations ciphered and stored in secured Flash memory
- ▶ **Overhead?**

Conclusion

- ▶ Hardware Trojans are **real threats** for integrated circuits
- ▶ HT **taxonomy** is very rich
- ▶ No HT detection method of the state-of-the-art is **100% successful**
- ▶ **3** lines of defense:
 - ▶ Design for Hardware Trust
 - ▶ Test-Time Methods
 - ▶ Run-Time Methods
- ▶ A European initiative: **HINT** project
 - ▶ **Let's talk about it during the coffee breaks!**
- ▶ Very **encouraging** first results:
 - ▶ **Infected benchmark circuits** are available
 - ▶ Detection with **side-channel analysis**
 - ▶ **Internal circuit delays** extraction

Thanks! Questions?
