

# Advanced Operating Systems (CS 202)

Instructor: Heng Yin

UNIVERSITY OF CALIFORNIA, RIVERSIDE

UNIVERSITY OF CALIFORNIA  
**UCR**RIVERSIDE

## Today

- › Course organization and mechanics
- › Introduction to OS

2

## What is this course about?

- › How has the role of the operating system evolved over time?
  - › How does the past inform the present?
- › What are the principles that underlie Operating Systems?
- › What are current and future trends in OS?
- › Make it real: projects to get some experience with OS development
- › *Get you ready to do Systems research*

3

## Some topics we will cover

- › Operating Systems models and how they evolved
  - › Monolithic kernels, micro-kernels, ...
    - › extensibility, protection, performance
- › Concurrency:
  - › Synchronization and Scheduling
  - › Multicore OS
- › File systems:
  - › Sequential, networked, distributed, internet scale
- › Virtualization:
  - › Intel VT, Containers
- › Other advanced topics

4

## Class format

- ▶ For every topic:
  - ▶ Some overview
  - ▶ Discuss research papers
- ▶ Research papers:
  - ▶ Critique for some required papers (1 paper most weeks)
    - ▶ Additional papers discussed in class
    - ▶ You are responsible for required papers and material discussed in class

5

## Questions while reading papers

- ▶ What are the primary goals (hypothesis)?
  - ▶ 2 sentence elevator pitch
- ▶ Why did the authors do what they did the way they did?
  - ▶ Understand motivation for design
- ▶ What were the driving forces for the paper at the time it was written?
- ▶ What parts still hold? What parts don't?
- ▶ How did they experiment to support their ideas?

6

## Reading Research Papers

- › Guidelines for reading papers
  - › Make sure to identify authors' goals and assumptions. Not always directly stated.
  - › Look for high-level takeaways.
  - › **Simulate the whole process in your head**
  - › Follow a multi-pass reading strategy
    - › Pass1: Get overview. Pass2: Read details and make notes. Pass3: Re-read details to evaluate.
  - › Think how techniques used are applicable today. Identify extensions.

7

## Projects

- › 2 Mandatory Projects
  - › Modification on xv6
  - › Closely related to the topics discussed

8

## Expectations and little bit about me

- › I do research in system security
  - › I know some aspects about modern operating systems very well (Windows/Linux/Android, etc.)
  - › This is my second time to systematically teach OS
  
- › Expect to discuss and learn with you altogether
  - › Read papers carefully
  - › Actively participate in class discussions
  - › Your participation counts 10% of your final grade!

9

## Class Logistics

- › Grader: Sri Shaila
  - › Office hours and contact information on the class website.
  - › Mainly responsible for lab assignments
- › Class website:  
<http://www.cs.ucr.edu/~heng/teaching/cs202-fall17/>
- › Piazza:  
<https://piazza.com/ucr/fall2017/cs202/home>

10

## Grading Policy

- › Project Assignments ← 30%
  - › Reading and critiquing papers
  - › Attendance
  - › Asking/answering questions
- } 20%
- › Mid-term ← 20%
  - › Final ← 30%

11

## Course Material

- › I assume you know undergraduate material
  - › If you need background, I suggest:
    - › OS, 3 easy pieces: <http://pages.cs.wisc.edu/~remzi/OSTEP/>
      - › Its free!
      - › Its excellent!
- › **Most material from published research papers**

12

## Pre-requisites

- › May recap basics of OS, but if so it will be quick
- › **To do well, you must have had undergrad OS or equivalent preparation**
- › **Architecture, networks, distributed systems courses are also a plus.**

13

## Questions?

- › Schedule will be posted incrementally on course website

<http://www.cs.ucr.edu/~heng/teaching/cs202-fall17>

- › Watch out for course announcements on

<http://ilearn.ucr.edu>

And Piazza

<https://piazza.com/ucr/fall2017/cs202/home>

14

## Situation

- › We all have multiple applications running on our smart phone or computer
  - › Written by programmers that don't know each other
  - › They all just magically work – how??
- › Goal today: get you ready to discuss OS structure, our first topic

15

## Computing Systems – a hierarchy of abstractions

- › Computing systems are a series of abstractions
  - › Impossible to think about a system from electrons to application in one shot
  - › What are some abstraction layers we have from transistors to applications?
- › This class: OS level abstractions

16

## What is an OS?

- › Directly has access to underlying hardware
- › Hides hardware complexity
  - › Offers nice abstractions to the applications through system calls
- › Manage the hardware on behalf of one or more applications
- › Ensures that applications are isolated and protected from each other

17

## Getting more technical

- › What is an OS?
  - › A piece of software that *abstracts* and *arbitrates* a computing system
- › A manager in a shop
  - › Directs resources
    - › Controls CPUs, memory, devices...
  - › Enforces working policies
    - › Fairness, resource limits, ...
  - › Simplifies complex tasks
    - › Abstracts hardware; offers system calls

18

## Abstraction and Arbitration

- › OS offers abstractions and arbitration
- › Example of arbitration?
  - › Allocate memory or CPU time
  - › Arbitrate access to a shared device
- › Examples of abstractions?
  - › Files, sockets, process, thread, ...

19

## Abstractions, mechanisms, policies

- › Memory management example
- › Abstraction: memory page
- › Mechanisms: allocate, map to a process, deallocate
- › Policies: page replacement, LRU, LFU, ...

20

## Design principles

- ▶ Separation of mechanism and policy
  - ▶ Implement flexible mechanisms to support many policies
  
- ▶ Policies must optimize for the common case
  - ▶ Where will the OS be used?
  - ▶ What will the user want to execute?

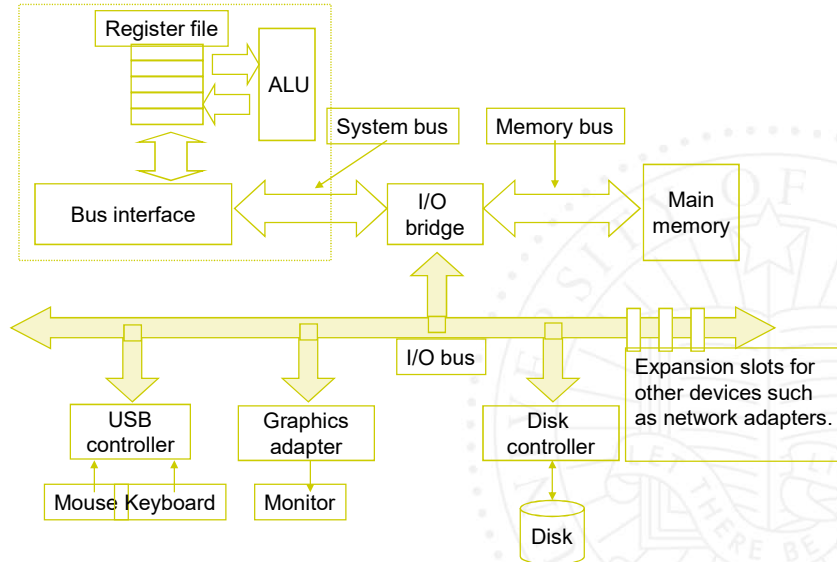

21

## Hardware and Resources

- ▶ Good understanding of the hardware is essential to understanding OS
- ▶ What hardware?
  - ▶ Smart phone/tablets?
  - ▶ Desktops?
  - ▶ Servers?
  - ▶ Computing clusters?
  - ▶ Cloud?
- ▶ How different are these?

22

## They are not that different!

## How does the OS interact with the hardware?

- OS
  - Has protected access to hardware resources
  - Arbitrates among competing requests
  - Receives and handles events from the hardware

## What support does the hardware provide to allow that?

- › **Manipulating privileged machine state**
  - › Protected instructions
  - › Manipulate device registers, TLB entries, etc.
  
- › **Generating and handling “events”**
  - › Interrupts, exceptions, system calls, etc.
  - › Respond to external events
  - › CPU requires software intervention to handle fault or trap
  
- › **Mechanisms to handle concurrency**
  - › Interrupts, atomic instructions

25

## Catering to Applications

- › Provide resource needs of an application
  - › CPU, memory, device access
- › When applications launch, the OS loads the program from file into memory
  - › Allocates memory for code, data, heap and stack
  - › Can the application ask for more resources?
    - › Yes, it receives additional requests and provides resources as needed
- › OS also reacts to events in the system
- › Gets out of the way as fast as possible

26

## CPU management

- › Abstractions
  - › Program: static entity
  - › Process: program in execution
    - › Unit of resource allocation and one thread of execution

27

## Memory management

- › Abstractions:
  - › Address space for each processor
- › OS implements these abstractions using the available hardware support
  - › Paging, segmentation, TLBs, caches...

28

## Storage/file system

- › Abstraction: Files and directories
  - › Others possible: e.g., object store
- › Implemented in a variety of different ways
  - › Traditional file system: mapping of files to storage
  - › Network file system
  - › Distributed FS
  - › Internet scale FS

29

## Conclusions

- › Today was a quick overview of the role of an OS
- › Goal is to get you ready to discuss OS organization and evolution, our first topic
  - › First reading assignment out this evening.
- › We did not discuss any implementation details
  - › You should know from undergraduate OS
  - › But please read on your own if you do not remember
